Pioneers in Computing and Mathematics

The pioneers pictured below are featured in our Computing Needs All Voices lesson. To learn more about them and their contributions, visit <https://bit.ly/bootstrap-pioneers>.

We are in the process of expanding our collection of pioneers. If there's someone else whose work inspires you, please let us know at <https://bit.ly/pioneer-suggestion>.

Notice and Wonder

Write down what you Notice and Wonder from the [What Most Schools Don't Teach](#) video.
"Notices" should be statements, not questions. What stood out to you? What do you remember? "Wonders" are questions.

What do you Notice?	What do you Wonder?

Windows and Mirrors

Think about the images and stories you've just encountered. Identify something(s) that served as a mirror for you, connecting you with your own identity and experience of the world. Write about who or what you connected with and why.

Identify something(s) from the film or the posters that served as a window for you, giving you insight into other people's experiences or expanding your thinking in some way.

Reflection: Problem Solving Advantages of Diverse Teams

This reflection is designed to follow reading [LA Times Perspective: A solution to tech's lingering diversity problem? Try thinking about ketchup](#)

1) The author argues that tech companies with diverse teams have an advantage. Why?

2) What suggestions did the article offer for tech companies looking to diversify their teams?

3) What is one thing of interest to you in the author's bio?

4) Think of a time when you had an idea that felt "out of the box". Did you share your idea? Why or why not?

5) Can you think of a time when someone else had a strategy or idea that you would never have thought of, but was interesting to you and/or pushed your thinking to a new level?

6) Based on your experience of exceptions to mainstream assumptions, propose another pair of questions that could be used in place of "Where do you keep your ketchup?" and "What would you reach for instead?"

Introduction to Programming

The **Editor** is a software program we use to write Code. Our Editor allows us to experiment with Code on the right-hand side, in the **Interactions Area**. For Code that we want to *keep*, we can put it on the left-hand side in the **Definitions Area**. Clicking the "Run" button causes the computer to re-read everything in the Definitions Area and erase anything that was typed into the Interactions Area.

Data Types

Programming languages involve different **data types**, such as Numbers, Strings, Booleans, and even Images.

- Numbers are values like `1`, `0.4`, `1/3`, and `-8261.003`.
 - Numbers are *usually* used for quantitative data and other values are *usually* used as categorical data.
 - In Pyret, any decimal *must* start with a 0. For example, `0.22` is valid, but `.22` is not.
- Strings are values like `"Emma"`, `"Rosanna"`, `"Jen and Ed"`, or even `"08/28/1980"`.
 - All strings *must* be surrounded by quotation marks.
- Booleans are either `true` or `false`.

All values evaluate to themselves. The program `42` will evaluate to `42`, the String `"Hello"` will evaluate to `"Hello"`, and the Boolean `false` will evaluate to `false`.

Operators

Operators (like `+`, `-`, `*`, `<`, etc.) work the same way in Pyret that they do in math.

- Operators are written between values, for example: `4 + 2`.
- In Pyret, operators must always have spaces around them. `4 + 2` is valid, but `4+2` is not.
- If an expression has different operators, parentheses must be used to show order of operations. `4 + 2 + 6` and `4 + (2 * 6)` are valid, but `4 + 2 * 6` is not.

Applying Functions

Applying functions works much the way it does in math. Every function has a name, takes some inputs, and produces some output. The function name is written first, followed by a list of **arguments** in parentheses.

- In math this could look like $f(5)$ or $g(10, 4)$.
- In Pyret, these examples would be written as `f(5)` and `g(10, 4)`.
- Applying a function to make images would look like `star(50, "solid", "red")`.
- There are many other functions, for example `num-sqr`, `num-sqrt`, `triangle`, `square`, `string-repeat`, etc.

Functions have **contracts**, which help explain how a function should be used. Every Contract has three parts:

- The *Name* of the function - literally, what it's called.
- The *Domain* of the function - what *type(s) of value(s)* the function consumes, and in what order.
- The *Range* of the function - what *type of value* the function produces.

Strings and Numbers

Make sure you've loaded [code.pyret.org \(CPO\)](http://code.pyret.org), clicked "Run", and are working in the **Interactions Area** on the right. Hit Enter/return to evaluate expressions you test out.

Strings

String values are always in quotes.

- Try typing your name (in quotes!).
- Try typing a sentence like "I'm excited to learn to code!" (in quotes!).
- Try typing your name with the opening quote, but *without the closing quote*. Read the error message!
- Now try typing your name *without any quotes*. Read the error message!

1) Explain what you understand about how strings work in this programming language. _____

Numbers

2) Try typing `42` into the Interactions Area and hitting "Enter". Is `42` the same as `"42"`? Why or why not?

3) What is the largest number the editor can handle?

4) Try typing `0.5`. Then try typing `.5`. Then try clicking on the answer. Experiment with other decimals.

Explain what you understand about how decimals work in this programming language. _____

5) What happens if you try a fraction like `1/3`? _____

6) Try writing **negative** integers, fractions and decimals. What do you learn? _____

Operators

7) Just like math, Pyret has **operators** like `+`, `-`, `*` and `/`.

Try typing in `4 + 2` and then `4+2` (without the spaces). What can you conclude from this?

8) Type in the following expressions, **one at a time**: `4 + 2 * 6` `(4 + 2) * 6` `4 + (2 * 6)` What do you notice?

9) Try typing in `4 + "cat"`, and then `"dog" + "cat"`. What can you conclude from this?

Booleans

Boolean-producing expressions are yes-or-no questions, and will always evaluate to either **true** ("yes") or **false** ("no").

What will the expressions below evaluate to? Write down your prediction, then type the code into the Interactions Area to see what it returns.

	Prediction	Result		Prediction	Result
1) <code>3 <= 4</code>	_____	_____	2) <code>"a" > "b"</code>	_____	_____
3) <code>3 == 2</code>	_____	_____	4) <code>"a" < "b"</code>	_____	_____
5) <code>2 < 4</code>	_____	_____	6) <code>"a" == "b"</code>	_____	_____
7) <code>5 >= 5</code>	_____	_____	8) <code>"a" <> "a"</code>	_____	_____
9) <code>4 >= 6</code>	_____	_____	10) <code>"a" >= "a"</code>	_____	_____
11) <code>3 <> 3</code>	_____	_____	12) <code>"a" <> "b"</code>	_____	_____
13) <code>4 <> 3</code>	_____	_____	14) <code>"a" >= "b"</code>	_____	_____

15) In your own words, describe what `<` does. _____

16) In your own words, describe what `>=` does. _____

17) In your own words, describe what `<>` does. _____

	Prediction:	Result:
--	-------------	---------

18) `string-contains("catnap", "cat")` _____

19) `string-contains("cat", "catnap")` _____

20) In your own words, describe what `string-contains` does. Can you generate another expression using `string-contains` that returns true?

★ There are infinite string values ("a", "aa", "aaa" ...) and infinite number values out there (...-2,-1,0,-1,2...). But how many different *Boolean* values are there? _____

Applying Functions

Open code.pyret.org (CPO) and click "Run". We will be working in the Interactions Area on the right.

Test out these two expressions and record what you learn below:

- `regular-polygon(40, 6, "solid", "green")`
- `regular-polygon(80, 5, "outline", "dark-green")`

1) You've seen data types like Numbers, Strings, and Booleans. What data type did the `regular-polygon` function produce? _____

2) How would you describe what a regular polygon is? _____

3) The `regular-polygon` function takes in four pieces of information (called arguments). Record what you know about them below.

	Data Type	Information it Contains
Argument 1		
Argument 2		
Argument 3		
Argument 4		

There are many other functions available to us in Pyret. We can describe them using **contracts**. The Contract for `regular-polygon` is:

```
# regular-polygon :: Number, Number, String, String -> Image
```

- Each Contract begins with the function name: *in this case* `regular-polygon` _____
- Lists the data types required to satisfy its Domain: *in this case* `Number, Number, String, String` _____
- And then declares the data type of the Range it will return: *in this case* `Image` _____

Contracts can also be written with more detail, by annotating the Domain with *variable names*:

```
# regular-polygon :: ( Number , Number , String , String ) -> Image  
                    size   number-of-sides fill-style color
```

4) We know that a square is a regular polygon because _____

5) What code would you write to make a big, blue square using the `regular-polygon` function?

```
_____ ( size :: Number , number-of-sides :: Number , fill-style :: String , color :: String )
```

6) Pyret also has a `square` function whose contract is: `# square :: (Number , String , String) -> Image`
 size fill-style color

What code would you write to make a big blue square using the `square` function?

```
_____ ( size :: Number , fill-style :: String , color :: String )
```

7) Why does `square` need fewer arguments to make a square than `regular-polygon`? _____

★ Where else have you heard the word **contract** used before?

Practicing Contracts: Domain & Range

Note: The contracts on this page are not defined in Pyret and cannot be tested in the editor.

is-beach-weather

Consider the following Contract:

```
# is-beach-weather :: Number, String -> Boolean
```

- 1) What is the **Name** of this function? _____
- 2) How many arguments are in this function's **Domain**? _____
- 3) What is the **Type** of this function's **first argument**? _____
- 4) What is the **Type** of this function's **second argument**? _____
- 5) What is the **Range** of this function? _____

6) Circle the expression below that shows the correct application of this function, based on its Contract.

- A. `is-beach-weather(70, 90)`
- B. `is-beach-weather(80, 100, "cloudy")`
- C. `is-beach-weather("sunny", 90)`
- D. `is-beach-weather(90, "stormy weather")`

cylinder

Consider the following Contract:

```
# cylinder :: Number, Number, String -> Image
```

- 7) What is the **Name** of this function? _____
- 8) How many arguments are in this function's **Domain**? _____
- 9) What is the **Type** of this function's **first argument**? _____
- 10) What is the **Type** of this function's **second argument**? _____
- 11) What is the **Type** of this function's **third argument**? _____
- 12) What is the **Range** of this function? _____

13) Circle the expression below that shows the correct application of this function, based on its Contract.

- A. `cylinder("red", 10, 60)`
- B. `cylinder(30, "green")`
- C. `cylinder(10, 25, "blue")`
- D. `cylinder(14, "orange", 25)`

Matching Expressions and Contracts

Match the Contract (left) with the expression described by the function being used (right).

Note: The contracts on this page are not defined in Pyret and cannot be tested in the editor.

Contract		Expression
<code># make-id :: String, Number -> Image</code>	1	A <code>make-id("Savannah", "Lopez", 32)</code>
<code># make-id :: String, Number, String -> Image</code>	2	B <code>make-id("Pilar", 17)</code>
<code># make-id :: String -> Image</code>	3	C <code>make-id("Akemi", 39, "red")</code>
<code># make-id :: String, String -> Image</code>	4	D <code>make-id("Raïssa", "McCracken")</code>
<code># make-id :: String, String, Number -> Image</code>	5	E <code>make-id("von Einsiedel")</code>

Contract		Expression
<code># is-capital :: String, String -> Boolean</code>	6	A <code>show-pop("Juneau", "AK", 31848)</code>
<code># is-capital :: String, String, String -> Boolean</code>	7	B <code>show-pop("San Juan", 395426)</code>
<code># show-pop :: String, Number -> Image</code>	8	C <code>is-capital("Accra", "Ghana")</code>
<code># show-pop :: String, String, Number -> Image</code>	9	D <code>show-pop(3751351, "Oklahoma")</code>
<code># show-pop :: Number, String -> Number</code>	10	E <code>is-capital("Albany", "NY", "USA")</code>

Contracts for Image-Producing Functions

Log into code.pyret.org (CPO) and click "Run". Experiment with each of the functions listed below in the interactions area. Try to find an expression that produces an image. Record the contract and example code for each function you are able to use!

Name	Domain	Range
# triangle	:: Number, String, String	-> Image
<i>triangle(80, "solid", "darkgreen")</i>		
# star	::	->
# circle	::	->
# rectangle	::	->
# text	::	->
# square	::	->
# rhombus	::	->
# ellipse	::	->
# regular-polygon	::	->
# right-triangle	::	->
# isosceles-triangle	::	->
# radial-star	::	->
# star-polygon	::	->
# triangle-sas	::	->
# triangle-asa	::	->

Catching Bugs when Making Triangles

Learning about a Function through Error Messages

- 1) Type `triangle` into the Interactions Area of [\(CPO\)](http://code.pyret.org) and hit "Enter". What do you learn? _____
- 2) We know that all functions will need an open parenthesis and at least one input! Type `triangle(80)` in the Interactions Area and hit Enter/return. Read the error message. What hint does it give us about how to use this function?

- 3) Using the hint from the error message, experiment until you can make a triangle. What is the contract for `triangle`?

What Kind of Error is it?

syntax errors - when the computer cannot make sense of the code because of unclosed strings, missing commas or parentheses, etc.
contract errors - when the function isn't given what it needs (the wrong type or number of arguments are used)

- 4) In your own words, the difference between **syntax errors** and **contract errors** is: _____

Finding Mistakes with Error Messages

The following lines of code are all BUGGY! Read the code and the error messages below. See if you can find the mistake WITHOUT typing it into Pyret.

- 5) `triangle(20, "solid" "red")`
Pyret didn't understand your program around
`triangle(20, "solid" "red")`
This is a _____ error. The problem is that _____
contract/syntax
- 6) `triangle(20, "solid")`
This application expression errored:
`triangle(20, "solid")`
2 arguments were passed to the **operator**. The **operator** evaluated to a function accepting 3 parameters. An application expression expects the number of parameters and arguments to be the same.
This is a _____ error. The problem is that _____
contract/syntax
- 7) `triangle(20, 10, "solid", "red")`
This application expression errored:
`triangle(20, 10, "solid", "red")`
4 arguments were passed to the **operator**. The **operator** evaluated to a function accepting 3 parameters. An application expression expects the number of parameters and arguments to be the same.
This is a _____ error. The problem is that _____
contract/syntax
- 8) `triangle (20, "solid", "red")`
Pyret thinks this code is probably a function call:
`triangle (20, "solid", "red")`
Function calls must not have space between the **function expression** and the arguments.
This is a _____ error. The problem is that _____
contract/syntax

Using Contracts

Use the contracts to write expressions to generate images similar to those pictured. Go to [code.pyret.org\(CPO\)](http://code.pyret.org(CPO)) to test your code.

```
# ellipse :: ( Number  
              width      , Number  
                      height , String  
                    fill-style , String  
                          color ) -> Image
```

	<p>Use the Contract to write an expression that generates a similar image:</p>
	<p>Use the Contract to write an expression that generates a similar image:</p>
<p>Write an expression using <code>ellipse</code> to produce a circle.</p>	

```
# regular-polygon :: ( Number  
                      side-length , Number  
                             number-of-sides , String  
                          fill-style , String  
                                color ) -> Image
```

	<p>Use the Contract to write an expression that generates a similar image:</p>
	<p>Use the Contract to write an expression that generates a similar image:</p>
<p>Use <code>regular-polygon</code> to write an expression for a square!</p>	
<p>How would you describe a regular polygon to a friend?</p>	

```
# rhombus :: ( Number  
              size      , Number  
                      top-angle , String  
                    fill-style , String  
                          color ) -> Image
```

	<p>Use the Contract to write an expression that generates a similar image:</p>
	<p>Use the Contract to write an expression that generates a similar image:</p>
<p>Write an expression to generate a <code>rhombus</code> that is a square!</p>	

Triangle Contracts

Respond to the questions. Go to [code.pyret.org\(CPO\)](http://code.pyret.org(CPO)) to test your code.

1) What kind of triangle does the `triangle` function produce? _____

There are lots of other kinds of triangles! And Pyret has lots of other functions that make triangles!

```
# triangle :: (Number, String, String) -> Image
              size    fill-style  color
# right-triangle :: (Number, Number, String, String) -> Image
                   base    height  fill-style  color
# isosceles-triangle :: (Number, Number, String, String) -> Image
                     leg    angle  fill-style  color
```

2) Why do you think `triangle` only needs one number, while `right-triangle` and `isosceles-triangle` need two numbers?

3) Write `right-triangle` expressions for the images below using `100` as one argument for each.

4) Write `isosceles-triangle` expressions for the images below using `100` as one argument for each.

5) Write 2 expressions that would build **right-isosceles** triangles. Use `right-triangle` for one expression and `isosceles-triangle` for the other expression.

6) Which do you like better? Why? _____

Radial Star

radial-star :: (Number_{points}, Number_{outer-radius}, Number_{inner-radius}, String_{fill-style}, String_{color}) -> Image

Using the Contract above, match the images on the left to the expressions on the right. You can test the code at [code.pyret.org\(CPO\)](http://code.pyret.org(CPO)).

1

A

```
radial-star(5, 200, 50, "solid", "black")
```

2

B

```
radial-star(7, 200, 100, "solid", "black")
```

3

C

```
radial-star(7, 200, 100, "outline", "black")
```

4

D

```
radial-star(10, 200, 150, "solid", "black")
```

5

E

```
radial-star(10, 200, 20, "solid", "black")
```

6

F

```
radial-star(100, 200, 20, "outline", "black")
```

7

G

```
radial-star(100, 200, 100, "outline", "black")
```

Composing with Circles of Evaluation

Notice and Wonder

Suppose we want to see the `text` "Diego" written vertically in yellow letters of size 150. Let's use Circles of Evaluation to look at the structure:

We can start by generating the Diego image.

```
text("Diego", 150, "yellow")
```

And then use the `rotate` function to rotate it 90 degrees.

```
rotate(90, text("Diego", 150, "yellow"))
```

1) What do you Notice? _____

2) What do you Wonder? _____

Let's Rotate an Image of Your Name!

Suppose you wanted the computer to show your name in your favorite color and rotate it so that it's diagonal...

3) Draw the circle of evaluation to generate the image of your name in your favorite color.	4) Draw the circle of evaluation to <code>rotate</code> it so that it's diagonal.
5) Convert the Circle of Evaluation to code.	6) Convert the Circle of Evaluation to code.

Function Composition – Green Star

1) Draw a Circle of Evaluation and write the Code for a **solid, green star, size 50**. Then go to [code.pyret.org \(CPO\)](http://code.pyret.org) to test your code.

Circle of Evaluation:

Code: _____

Using the star described above as the **original**, draw the Circles of Evaluation and write the Code for each exercise below. Test your code in the editor.

2) A solid, green star, that is triple the size of the original (using scale)	3) A solid, green star, that is half the size of the original (using scale)
4) A solid, green star of size 50 that has been rotated 45 degrees counter-clockwise	5) A solid, green star that is 3 times the size of the original and has been rotated 45 degrees

Function Composition – Your Name

You'll be investigating these functions with your partner:

```
# text :: String, Number, String -> Image
# flip-horizontal :: Image -> Image
# flip-vertical :: Image -> Image
# frame :: Image -> Image
# above :: Image, Image -> Image
# beside :: Image, Image -> Image
```

1) In the editor, write the code to make an image of your name in big letters in a color of your choosing using `text`. Then draw the Circle of Evaluation and write the Code that will create the image.

Circle of Evaluation for an "image of your name":

Code for an "image of your name": _____

Using the "image of your name" described above as the **original**, draw the Circles of Evaluation and write the Code for each exercise below. Test your ideas in the editor to make sure they work.

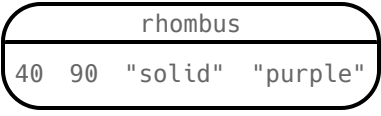

2) The framed "image of your name".	3) The "image of your name" flipped vertically.
4) The "image of your name" above a vertical reflection of the "image of your name"	5) The "image of your name" flipped horizontally beside "the image of your name".

Function Composition – scale-xy

You'll be investigating these two functions with your partner:

```
# scale-xy :: (Number, Number, Image) -> Image
             x-scale-factor y-scale-factor img-to-scale
```

```
# overlay :: (Image, Image) -> Image
             top bottom
```

The Image:	Circle of Evaluation:	Code:
		<pre>rhombus(40, 90, "solid", "purple")</pre>

Starting with the image described above, write Circles of Evaluation and Code for each exercise below. *Be sure to test your code!*

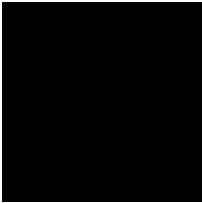

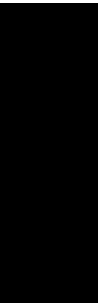

1) A purple rhombus that is stretched 4 times as wide.	2) A purple rhombus that is stretched 4 times as tall
3) The tall rhombus from #1 overlaid on the wide rhombus (#2).	
★ Overlay a red rhombus onto the last image you made in #3.	

More than one way to Compose an Image!

What image will each of the four expressions below evaluate to?
If you're not sure, go to [code.pyret.org \(CPO\)](http://code.pyret.org/CPO), and type them into the Interactions Area and see if you can figure out how the code constructs its image.

```
beside(rectangle(200, 100, "solid", "black"), square(100, "solid", "black"))  
scale-xy(1, 2, square(100, "solid", "black"))  
scale(2, rectangle(100, 100, "solid", "black"))  
above(  
  rectangle(100, 50, "solid", "black"),  
  above(  
    rectangle(200, 100, "solid", "black"),  
    rectangle(100, 50, "solid", "black")))
```

For each image below, identify 2 expressions that could be used to compose it. The bank of expressions at the top of the page includes one possible option for each image.

1	 <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/>
2	 <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/>
3	 <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/>
★	 <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/> <hr/>

Defining Values

In math, we use values, expressions and definitions.

- **Values** include things like: -98.1 $\frac{2}{3}$ 42
- **Expressions** include things like: 1×3 $\sqrt{16}$ $5 - 2$
 - These evaluate to results, and typing any of them in as code produces some answer.
- **Definitions** are different from values and expressions, because *they do not produce results*. Instead, they simply create names for values, so that those names can be re-used to make the Math simpler and more efficient.
 - Definitions always have both a name and an expression.
 - The name goes on the left and is defined by an equals sign to be the result of a value-producing expression on the right:
 $x = 4$
 $y = 9 + x$
 - The above examples tells us:
"x is defined to be 4."
"y is defined to be 13."
 - **Important: there is no "answer" to a definition**, and typing in a definition as code will produce no result.
 - Notice that *once a value has been defined, it can be used in subsequent definitions*. In the example above...
The definition of `y` refers to `x`.
The definition of `x`, on the other hand, *cannot* refer to `y`, because it comes before `y` is defined.

In Pyret, definitions are written the *exact same way*!

- Try typing these definitions into the Definitions Area on the left, clicking "Run", and then *using* them in the Interactions Area on the right.
 - `x = 4`
 - `y = 9 + x`

Just like in math, definitions in our programming language can only refer to previously-defined values.

- Here are a few more value definitions. Feel free to type them in, and make sure you understand them.
 - `x = 5 + 1`
 - `y = x * 7`
 - `food = "Pizza!"`
 - `dot = circle(y, "solid", "red")`

Defining Values - Explore

Open the [Defining Values Starter File](#) and click "Run".

1) What do you Notice?

2) What do you Wonder?

For each of the expressions listed below, write your *prediction* for what you expect Pyret to produce? Once you have completed your predictions, test them out one at a time in the Interactions Area.

	Prediction	Result		Prediction	Result
3) <code>x</code>	<hr/>	<hr/>	4) <code>x + 5</code>	<hr/>	<hr/>
5) <code>y - 9</code>	<hr/>	<hr/>	6) <code>x * y</code>	<hr/>	<hr/>
7) <code>z</code>	<hr/>	<hr/>	8) <code>t</code>	<hr/>	<hr/>
9) <code>gold-star</code>	<hr/>	<hr/>	10) <code>my-name</code>	<hr/>	<hr/>
11) <code>swamp</code>	<hr/>	<hr/>	12) <code>c</code>	<hr/>	<hr/>

13) In the code, find the definitions of `exampleA`, `exampleB`, and `exampleC`. These all define the same shape, but their definitions are split across several lines. Suppose you *had* to split your code across multiple lines like this. Which one of these is the easiest to read, and why?

14) Define at least 2 more variables in the Definitions Area, click "Run" and test them out. Once you know they're working, record the code you used below.

15) What have you learned about defining values?

Which Value(s) Would it Make Sense to Define?

For each of the images below, identify which element(s) you would want to define before writing code to compose the image.

Hint: what gets repeated?

Philippines

St. Vincent & the Grenadines

Liberia

Republic of Georgia

Quebec

South Korea

Chinese Flag

The image value on the left called `china` is defined by the code on the right.

```
china =  
  put-image(  
    rotate(40,star(15,"solid","yellow")),  
    120, 175,  
    put-image(  
      rotate(80,star(15,"solid","yellow")),  
      140, 150,  
      put-image(  
        rotate(60,star(15,"solid","yellow")),  
        140, 120,  
        put-image(  
          rotate(40,star(15,"solid","yellow")),  
          120, 90,  
          put-image(scale(3,star(15,"solid","yellow")),  
            60, 140,  
            rectangle(300, 200, "solid", "red"))))))))
```

1) What image do you see repeated in the flag?

2) Highlight or underline every place in the code  that you see the repeated expression for that image.

3) Write the code to **define a value** for the repeated expression.

4) Open the [Flag of China Starter File](#), save a copy and click "Run". Simplify the code, replacing the repeated expressions with the value you defined. Do you still get the same image when you click "Run"? If not, check your work.

5) Change the color of all the stars to black, then change their size to 20. Would this have been easier with the original code? Why or why not?

6) Here is the same code shown above, but all crammed into one line.

```
china = put-image(rotate(40, star(15, "solid", "yellow")), 120, 175, put-image(rotate(80, star(15, "solid", "yellow")), 140, 150, put-image(rotate(60, star(15, "solid", "yellow")), 140, 120, put-image(rotate(40, star(15, "solid", "yellow")), 120, 90, put-image(scale(3, star(15, "solid", "yellow")), 60, 140, rectangle(300, 200, "solid", "red"))))))))
```

Is it easier or harder to read, when everything is all on one line? _____

7) Professional programmers *indent* their code, by breaking long lines into shorter, more readable lines of code. In the indented code at the top of the page, notice that each `put-image` is followed by several lines of code that all line up with each other, and that the lines under the next `put-image` are shifted farther and farther to the right. What do you think is going on?

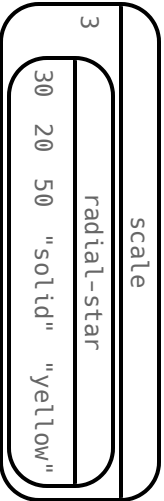

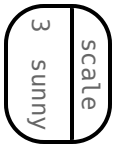

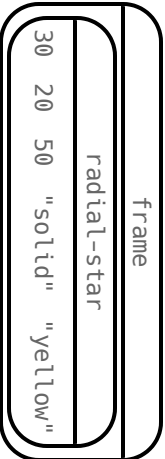

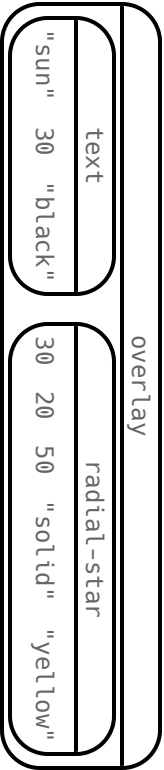

★ This file uses a function we haven't seen before! What is its name? _____ *Hint: Focus on the last instance of the function.*

How many inputs are in its domain? _____. What are the types of those inputs? _____

Why Define Values?

Take a close look at the Original Circle of Evaluation & Code and how it got simplified.

- 1) Write the code that must have been used to define the value of `sunny`.
- 2) Complete the table using the first row as an example.

Original Circle of Evaluation & Code	→	Use the defined value <code>sunny</code> to simplify!
	→	
<code>scale(3, radial-star(30, 20, 50, "solid", "yellow"))</code>	→	Code: <code>scale(3, sunny)</code>
Second Circle of Evaluation & Code	→	Use the defined value <code>sunny</code> to simplify!
	→	Code:
Third Circle of Evaluation & Code	→	Use the defined value <code>sunny</code> to simplify!
	→	Code:

3) Define `sunny` in the Definitions Area using the code you recorded at the top of the page.

4) Test your code in the editor and make sure it produces what you would expect it to.

Writing Code using Defined Values

1) On the line below, write the Code to define `PRIZE-STAR` as the pink outline of a size 65 star.

Using the `PRIZE-STAR` definition from above, draw the Circle of Evaluation and write the Code for each of the exercises.

Be sure to test out your code in [code.pyret.org\(CPO\)](http://code.pyret.org(CPO)) before moving onto the next item. One Circle of Evaluation has been done for you.

2 The outline of a pink star that is three times the size of the original (using `scale`)

Circle of Evaluation:

Code:

3 The outline of a pink star that is half the size of the original (using `scale`)

Circle of Evaluation:

Code:

4 The outline of a pink star that is rotated 45 degrees
(It should be the same size as the original.)

Circle of Evaluation:

Code:

5 The outline of a pink star that is three times as big as the original
and has been rotated 45 degrees

Circle of Evaluation:

Code:

6) How does defining values help you as a programmer?

Making Sense of Coordinates

```
dot = circle(50, "solid", "red")  
background = rectangle(300, 200, "outline", "black")
```

Think of the background image as a sheet of graph paper with the origin (0,0) in the bottom left corner. The width of the rectangle is 300 and the height is 200. The numbers in `put-image` specify a point on that graph paper, where the center of the top image (in this case `dot`) should be placed.

What coordinates would you expect were used to place the `dot` for each of the following images?

1)

`put-image(dot, _____, _____ background)`

2)

`put-image(dot, _____, _____ background)`

3)

`put-image(dot, _____, _____ background)`

4)

`put-image(dot, _____, _____ background)`

Investigating put-image

Japan

For this section of the page, you will refer to the [Flags Starter File](#).

- 1) Each language has its own symbol for commenting code so that programmers can leave notes that won't be read by the computer. In Pyret, we use the hash mark (#). What color are comments in Pyret? _____
- 2) Type `japan-flag` into the Interactions Area. What do you get back? _____

- 3) Type `japan` into the Interactions Area and compare the image to `japan-flag` .
 - How are they alike? _____
 - How are they different? _____
- 4) `japan` is composed using `dot` and `background` . Type each of those variables into the Interactions Area. What do you get back?
 - dot: _____
 - background: _____
- 5) These images are combined using the `put-image` function. What is its contract? _____
- 6) Fix the `japan` code so that it matches the `japan-flag` image. What did you need to change? _____

- 7) How can you prove that you have placed the `dot` in exactly the right location? _____

The Netherlands

For this section of the page, you will refer to the [Flags of Netherlands, France & Mauritius Starter File](#).

- 8) What was the programmer thinking when she coded the height of the red stripe as `200 / 3` ? _____

- 9) The center of the blue stripe is placed at (`150` , `200 / 6`). How did the programmer know to use 150 as the x-coordinate? _____

- 10) What was the programmer thinking when she coded the y-coordinate as `200 / 6` ? _____

- 11) Explain the thinking behind coding the red stripe's y-coordinate as `5 * (200 / 6)` . _____

- 12) What advantages are there to representing height, length, or width as fractions (as the coder did here) rather than computing and using the value? _____

Defining Functions

Functions can be viewed in *multiple representations*. You already know one of them: **Contracts**, which specify the Name, Domain, and Range of a function. Contracts are a way of thinking of functions as a *mapping* between one set of data and another. For example, a mapping from Numbers to Strings:

```
# f :: Number -> String
```

Another way to view functions is with **Examples**. Examples are essentially input-output tables, showing what the function would do for a specific input:

In our programming language, we focus on the last two columns and write them as code:

```
examples :  
  f(1) is 1 + 2  
  f(2) is 2 + 2  
  f(3) is 3 + 2  
  f(4) is 4 + 2  
end
```

Finally, we write a formal **function definition** ourselves. The pattern in the Examples becomes *abstract* (or "general"), replacing the inputs with **variables**. In the example below, the same definition is written in both math and code:

```
 $f(x) = x + 2$   
fun f(x): x + 2 end
```

Look for connections between these three representations!

- The function name is always the same, whether looking at the Contract, Examples, or Definition.
- The number of inputs in the Examples is always the same as the number of types in the Domain, which is always the same as the number of variables in the Definition.
- The "what the function does" pattern in the Examples is almost the same in the Definition, but with specific inputs replaced by variables.

The Great gt domain debate!

Kermit: The domain of `gt` is `Number, String, String`.

Oscar: The domain of `gt` is `Number`.

Ernie: I'm not sure who's right!

In order to make a triangle, we need a size, a color and a fill style...

but all we had to tell our actor was `gt(20)` ...and they returned `triangle(20, "solid", "green")`.

Please help us!

1) What is the correct domain for `gt`?

2) What could you tell Ernie to help him understand how you know?

Let's Define Some New Functions!

1) Let's define a function `rs` to generate solid red squares of whatever size we give them!

If I say `rs(5)`, what would our actor need to say?

Let's write a few more examples:

`rs()` → _____

`rs()` → _____

`rs()` → _____

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable:

```
fun rs( ): _____ end
```

2) Let's define a function `bigc` to generate big solid circles of size 100 in whatever color we give them!

If I say `bigc("orange")`, what would our actor need to say?

Let's write a few more examples:

`bigc()` → _____

`bigc()` → _____

`bigc()` → _____

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable:

```
fun bigc( ): _____ end
```

3) Let's define a function `ps` to build a pink star of size 50, with the input determining whether it's solid or outline!

If I say `ps("outline")`, what would our actor need to say?

Write examples for all other possible inputs:

`ps()` → _____

`ps()` → _____

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable:

```
fun ps( ): _____ end
```

4) Add these new function definitions to your [gt Starter File](#) and test them out!

Let's Define Some More New Functions!

1) Let's define a function `sun` to write **SUNSHINE** in whatever color and size we give it!

If I say `sun(5, "blue")`, what would our actor need to say?

Let's write a few more examples:

`sun(____, _____)` → _____

`sun(____, _____)` → _____

`sun(____, _____)` → _____

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable(s):

```
fun sun(_____, _____):
```

```
_____ end
```

2) Let's define a function `me` to generate your name in whatever size and color we give it!

If I say `me(18, "gold")`, what would our actor need to say?

Let's write a few more examples:

`me(____, _____)` → _____

`me(____, _____)` → _____

`me(____, _____)` → _____

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable(s):

```
fun me(_____, _____):
```

```
_____ end
```

3) Let's define a function `gr` to build a solid, green rectangle of whatever height and width we give it!

If I say `gr(10, 80)`, what would our actor need to say?

Let's write a few more examples:

`gr(____, ____)` → `rectangle(____, ____, "solid", "green")`

`gr(____, ____)` → `rectangle(____, ____, "solid", "green")`

`gr(____, ____)` → `rectangle(____, ____, "solid", "green")`

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable(s):

```
fun gr(_____, _____):
```

```
_____ end
```

4) Add these new function definitions to your [gt Starter File](#) and test them out!

Describe and Define Your Own Functions!

1) Let's define a function _____ to generate...

If I say _____, what would our actor need to say? _____

Let's write a few more examples:

_____ (_____) → _____ (_____)

_____ (_____) → _____ (_____)

_____ (_____) → _____ (_____)

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable.

```
fun _____ ( _____ ): _____ end
```

2) Let's define a function _____ to generate...

If I say _____, what would our actor need to say? _____

Let's write a few more examples:

_____ (_____) → _____ (_____)

_____ (_____) → _____ (_____)

_____ (_____) → _____ (_____)

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable.

```
fun _____ ( _____ ): _____ end
```

3) Let's define a function _____ to generate...

If I say _____, what would our actor need to say? _____

Let's write a few more examples:

_____ (_____) → _____ (_____)

_____ (_____) → _____ (_____)

_____ (_____) → _____ (_____)

What changes in these examples? Name your variable(s): _____

Let's define our function using the variable.

```
fun _____ ( _____ ): _____ end
```

4) Add your new function definitions to your [gt Starter File](#) and test them out!

Matching Examples and Contracts

Match each set of examples (left) with the Contract that best describes it (right).

Examples	Contract
<pre>examples: f(5) is 5 / 2 f(9) is 9 / 2 f(24) is 24 / 2 end</pre>	<p>1 A # f :: Number -> Number</p>
<pre>examples: f(1) is rectangle(1, 1, "outline", "red") f(6) is rectangle(6, 6, "outline", "red") end</pre>	<p>2 B # f :: String -> Image</p>
<pre>examples: f("pink", 5) is star(5, "solid", "pink") f("blue", 8) is star(8, "solid", "blue") end</pre>	<p>3 C # f :: Number -> Image</p>
<pre>examples: f("Hi!") is text("Hi!", 50, "red") f("Ciao!") is text("Ciao!", 50, "red") end</pre>	<p>4 D # f :: Number, String -> Image</p>
<pre>examples: f(5, "outline") is star(5, "outline", "yellow") f(5, "solid") is star(5, "solid", "yellow") end</pre>	<p>5 E # f :: String, Number -> Image</p>

Matching Examples and Function Definitions

(1) Find the variables in `gt` and label them with the word "size".

examples:

```
gt(20) is triangle(20, "solid", "green")
```

```
gt(50) is triangle(50, "solid", "green")
```

end

```
fun gt(size): triangle(size, "solid", "green") end
```

(2) Highlight and label the variables in the example lists below.

(3) Then, using `gt` as a model, match the examples to their corresponding function definitions.

Examples			Definition
<pre>examples: f("solid") is circle(8, "solid", "red") f("outline") is circle(8, "outline", "red") end</pre>	1	A	<pre>fun f(s): star(s, "outline", "red") end</pre>
<pre>examples: f(2) is 2 + 2 f(4) is 4 + 4 f(5) is 5 + 5 end</pre>	2	B	<pre>fun f(num): num + num end</pre>
<pre>examples: f("red") is circle(7, "solid", "red") f("teal") is circle(7, "solid", "teal") end</pre>	3	C	<pre>fun f(c): star(9, "solid", c) end</pre>
<pre>examples: f("red") is star(9, "solid", "red") f("grey") is star(9, "solid", "grey") f("pink") is star(9, "solid", "pink") end</pre>	4	D	<pre>fun f(s): circle(8, s, "red") end</pre>
<pre>examples: f(3) is star(3, "outline", "red") f(8) is star(8, "outline", "red") end</pre>	5	E	<pre>fun f(c): circle(7, "solid", c) end</pre>

Creating Contracts From Examples

Write the contracts used to create each of the following collections of examples. The first one has been done for you.

1) `# big-triangle :: Number, String -> Image`

```
examples:  
  big-triangle(100, "red") is triangle(100, "solid", "red")  
  big-triangle(200, "orange") is triangle(200, "solid", "orange")  
end
```

2) _____

```
examples:  
  purple-square(15) is rectangle(15, 15, "outline", "purple")  
  purple-square(6) is rectangle(6, 6, "outline", "purple")  
end
```

3) _____

```
examples:  
  sum(5, 8) is 5 + 8  
  sum(9, 6) is 9 + 6  
  sum(120, 11) is 120 + 11  
end
```

4) _____

```
examples:  
  banner("Game Today!") is text("Game Today!", 50, "red")  
  banner("Go Team!") is text("Go Team!", 50, "red")  
  banner("Exit") is text("Exit", 50, "red")  
end
```

5) _____

```
examples:  
  twinkle("outline", "red") is star(5, "outline", "red")  
  twinkle("solid", "pink") is star(5, "solid", "pink")  
  twinkle("outline", "grey") is star(5, "outline", "grey")  
end
```

6) _____

```
examples:  
  half(5) is 5 / 2  
  half(8) is 8 / 2  
  half(900) is 900 / 2  
end
```

7) _____

```
examples:  
  Spanish(5) is "cinco"  
  Spanish(30) is "treinta"  
  Spanish(12) is "doce"  
end
```

Contracts, Examples & Definitions - bc

We've already found the Contract for *gt*, generated Examples and described the pattern with a Function Definition. Let's review our process, beginning with the Word Problem.

Directions: Define a function called *gt*, which makes solid green triangles of whatever size we want.

Contract and Purpose Statement

Every contract has three parts...

gt :: Number -> Image
function name Domain Range

Examples

Write some examples, then circle and label what changes...

examples:

gt(10) is triangle(10, "solid", "green")
function name input(s) what the function produces

gt(20) is triangle(20, "solid", "green")
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun gt(size): triangle(size, "solid", "green")
function name variable(s) what the function does with those variable(s)

end

Now, let's apply the same steps to think through a new problem!

Directions: Define a function called *bc*, which makes solid blue circles of whatever radius we want.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name Domain Range

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____): _____
function name variable(s) what the function does with those variable(s)

end

Contracts, Examples & Definitions - Stars

Directions: Define a function called `sticker`, which consumes a color and draws a solid 50px star of the given color.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name Domain Range

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)
_____ what the function does with those variable(s)

end

Directions: Define a function called `gold-star`, which takes in a radius and draws a solid gold star of that given size.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name Domain Range

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)
_____ what the function does with those variable(s)

end

Contracts, Examples & Definitions - Name

Directions: Define a function called name-color, which makes an image of your name at size 50 in whatever color is given.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name Domain Range

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)
_____ what the function does with those variable(s)

end

Directions: Define a function called name-size, which makes an image of your name in your favorite color (be sure to specify your name and favorite color!) in whatever size is given.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name Domain Range

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)
_____ what the function does with those variable(s)

end

Solving Word Problems

Being able to see functions as Contracts, Examples or Definitions is like having three powerful tools. These representations can be used together to solve word problems! We call this **The Design Recipe**.

- 1) When reading a word problem, the first step is to figure out the **Contract** for the function you want to build. Remember, a Contract must include the Name, Domain and Range for the function!
- 2) Then we write a **Purpose Statement**, which is a short note that tells us what the function *should do*. Professional programmers work hard to write good purpose statements, so that other people can understand the code they wrote! Programmers work on teams; the programs they write must outlast the moment that they are written.
- 3) Next, we write at least two **Examples**. These are lines of code that show what the function should do for a *specific* input. Once we see examples of at least two inputs, we can *find a pattern* and see which parts are changing and which parts aren't.
- 4) To finish the Examples, we circle the parts that are changing, and label them with a short **variable name** that explains what they do.
- 5) Finally, we **define the function** itself! This is pretty easy after you have some examples to work from: we copy everything that didn't change, and replace the changeable stuff with the variable name!

Matching Word Problems and Purpose Statements

Match each word problem below to its corresponding purpose statement.

Annie got a new dog, Xavier, that eats about 5 times as much as her little dog, Rex, who is 10 years old. She hasn't gotten used to buying enough dogfood for the household yet. Write a function that generates an estimate for how many pounds of food Xavier will eat, given the amount of food that Rex usually consumes in the same amount of time.

1

A

Consume the pounds of food Rex eats and add 5.

Adrienne's raccoon, Rex, eats 5 more pounds of food each week than her pet squirrel, Lili, who is 7 years older. Write a function to determine how much Lili eats in a week, given how much Rex eats.

2

B

Consume the pounds of food Rex eats and subtract 5.

Alejandro's rabbit, Rex, poops about $\frac{1}{5}$ of what it eats. His rabbit hutch is 10 cubic feet. Write a function to figure out how much rabbit poop Alejandro will have to clean up depending on how much Rex has eaten.

3

C

Consume the pounds of food Rex eats and multiply by 5.

Max's turtle, Rex, eats 5 pounds less per week than his turtle, Harry, who is 2 inches taller. Write a function to calculate how much food Harry eats, given the weight of Rex's food.

4

D

Consume the pounds of food Rex eats and divide by 5.

Writing Examples from Purpose Statements

We've provided contracts and purpose statements to describe two different functions. Write examples for each of those functions.

Contract and Purpose Statement

Every contract has three parts...

triple:: _____ *Number* -> _____ *Number*
function name Domain Range

Consumes a Number and triples it. _____
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Contract and Purpose Statement

Every contract has three parts...

upside-down:: _____ *Image* -> _____ *Image*
function name Domain Range

Consumes an image, and turns it upside down by rotating it 180 degrees. _____
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Fixing Purpose Statements

Beneath each of the word problems below is a purpose statement (generated by ChatGPT!) that is either missing information or includes unnecessary information.

- Write an improved version of each purpose statement beneath the original.
- Then, explain what was wrong with the ChatGPT-generated Purpose Statement.

1) **Word Problem:** *The New York City ferry costs \$2.75 per ride. The Earth School requires two chaperones for any field trip. Write a function f a re that takes in the number of students in the class and returns the total fare for the students and chaperones.*

ChatGPT's Purpose Statement: Take in the number of students and add 2.

Improved Purpose Statement: _____

Problem with ChatGPT's Purpose Statement: _____

2) **Word Problem:** *It is tradition for the Green Machines to go to Humpy Dumpty's for ice cream with their families after their soccer games. Write a function cones to take in the number of kids and calculate the total bill for the team, assuming that each kid brings two family members and cones cost \$1.25.*

ChatGPT's Purpose Statement: Take in the number of kids on the team and multiply it by 1.25.

Improved Purpose Statement: _____

Problem with ChatGPT's Purpose Statement: _____

3) **Word Problem:** *The cost of renting an ebike is \$3 plus an additional \$0.12 per minute. Write a function ebike that will calculate the cost of a ride, given the number of minutes ridden.*

ChatGPT's Purpose Statement: Take in the number of minutes and multiply it by 3.12.

Improved Purpose Statement: _____

Problem with ChatGPT's Purpose Statement: _____

4) **Word Problem:** *Suleika is a skilled house painter at only age 21. She has painted hundreds of rooms and can paint about 175 square feet an hour. Write a function paint that takes in the number of square feet of the job and calculates how many hours it will take her.*

ChatGPT's Purpose Statement: Take in the number of square feet of walls in a house and divide them by 175 then add 21 years.

Improved Purpose Statement: _____

Problem with ChatGPT's Purpose Statement: _____

Word Problem: rocket-height

Directions: A rocket blasts off, and is now traveling at a constant velocity of 7 meters per second. Use the Design Recipe to write a function rocket-height, which takes in a number of seconds and calculates the height.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name Domain Range

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)

what the function does with those variable(s)

end

Word Problem: double-width

Directions: Write a function `double-width`, which takes in a number (the length of a rectangle) and produces a rectangle whose length is twice the given length.

Contract and Purpose Statement

Every contract has three parts...

function name :: _____ Domain _____ -> _____ Range _____
_____ what does the function do? _____

Examples

Write some examples, then circle and label what changes...
examples:

_____ (_____) is _____ what the function produces
_____ (_____) is _____ what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun function name (_____ variable(s)): _____
_____ what the function does with those variable(s)

end

Word Problem: next-position

Directions: Write a function `next-position`, which takes in two numbers (an x- and y-coordinate) and returns a `DeliveryState`, increasing the x-coordinate by 5 and decreasing the y-coordinate by 5.

Contract and Purpose Statement

Every contract has three parts...

```
# _____ :: _____ -> _____
      function name           Domain                      Range
# _____
                                     what does the function do?
```

Examples

Write some examples, then circle and label what changes...

examples:

```
_____ ( _____ ) is _____
function name       input(s)           what the function produces
```

```
_____ ( _____ ) is _____
function name       input(s)           what the function produces
```

end

Definition

Write the definition, giving variable names to all your input values...

```
fun _____ ( _____ ):
    function name       variable(s)
```

```
_____
                                     what the function does with those variable(s)
```

end

Data Structure: CakeType

```
# A CakeType is a flavor, layers, & is-iceCream
```

```
data CakeType:
```

```
  | cake( _____  
        _____  
        _____ )
```

```
end
```

1) To make an instance of this structure, I would write:

```
cake1 = _____
```

```
cake2 = _____
```

2) To access the fields of cake2, I would write:

```
_____  
_____  
_____
```

Word Problem: taller-than

Directions: Write a function called `taller-than`, which consumes two `CakeTypes`, and produces true if the number of layers in the first `CakeType` is greater than the number of layers in the second.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
 function name Domain Range

 what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
 function name input(s) what the function produces

_____ (_____) is _____
 function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____): _____
 function name variable(s)

_____ what the function does with those variable(s)

end

Word Problem: will-melt

Directions: Write a function called `will-melt`, which takes in a `CakeType` and a temperature, and returns true if the temperature is greater than 32 degrees, AND the `CakeType` is an ice-cream cake.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
 function name Domain Range

 what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
 function name input(s) what the function produces

_____ (_____) is _____
 function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
 function name variable(s)

_____ what the function does with those variable(s)

end

Identifying Animation Data Worksheet

Draw a sketch for three distinct moments of the animation

Sketch A

Sketch B

Sketch C

What things are changing?

Thing	Describe how it changes

What fields do you need to represent the things that change?

Field name (dangerX, score, playerIMG ...)	Data Type (Number, String, Image, Boolean ...)

Design a Data Structure

```
# a _____ State is _____  
data _____ State:  
  | _____ ( _____  
  _____  
  _____  
end
```

Make a sample instance for each sketch from the previous page:

_____ sketchA _____ = _____

_____ sketchB _____ = _____

_____ sketchC _____ = _____

Word Problem: draw-state

Write a function called *draw-state*, which takes in a *SunsetState* and returns an image in which the sun (a circle) appears at the position given in the *SunsetState*. The sun should be behind the horizon (the ground) once it is low in the sky.

Contract and Purpose Statement

`draw-state :: _____ -> Image`

Write an expression for each piece of your final image

SUN =	
GROUND =	
SKY =	

Write the *draw-state* function, using *put-image* to combine your pieces

`fun _____ (_____):`

_____ end

Word Problem: next-state-tick

Directions: Write a function called `next-state-tick`, which takes in a `SunsetState` and returns a `SunsetState` in which the new x-coordinate is 8 pixels larger than in the given `SunsetState` and the y-coordinate is 4 pixels smaller than in the given `SunsetState`.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name Domain Range

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____): _____
function name variable(s) _____
what the function does with those variable(s)

end

Define the Data Structure

```
# a _____ State is _____  
data _____ State:  
  | _____ ( _____  
  _____  
  _____  
  _____ )  
end
```

1) Make a sample instance for each sketch from the previous page

```
_____ = _____  
_____ = _____  
_____ = _____
```

2) Write an example for one of the functions on the previous page

```
_____  
_____  
_____  
_____  
_____
```

Line Length Explore

Sign in to code.pyret.org (CPO) and open your Game File.

Defining line-length

Find the definition for the line-length function and consider the code you see.

1) What do you Notice?

2) What do you Wonder?

Using line-length

Click Run, and practice using line-length in the **Interactions Area** with different values for a and b.

3) What does the line-length function do?

4) Why does it use conditionals?

5) Why is the distance between two points always positive?

Writing Code to Calculate Missing Lengths

In each of the game screenshots below, one of the distance labels has been hidden. Write the code to generate the missing distance on the line below each image. *Hint: Remember the Pythagorean Theorem!*

Proof Without Words

Long ago, mathematicians realized that there is a special relationship between the three squares that can be formed using the sides of a right triangle.

How would you describe the relationship you've observed between the three squares whose side-lengths are determined by the lengths of the sides of a right triangle?

Distance on the Coordinate Plane

Reading Code:

Distance between the Pyret and the boot:

```
num-sqrt(num-sqr(line-length(9, -3)) + num-sqr(line-length(3, -2)))
```

- 1) Where do the 9 and -3 come from? _____
- 2) Where do the 3 and -2 come from? _____
- 3) Explain how the code works. _____

Writing Code

Now write the code to find the distance between this boot and pyret.

Circles of Evaluation: Distance between (0, 2) and (4, 5)

Suppose your player is at (0, 2) and a character is at (4, 5)...

1) Identify the values of x_1 , y_1 , x_2 , and y_2

x_1	y_1	x_2	y_2
(x-value of 1st point)	(y-value of 1st point)	(x-value of 2nd point)	(y-value of 2nd point)

What is the distance between your player and the character?

- We can use `line-length` to compute the horizontal and vertical distances and then use those to find the diagonal distance.
 - The horizontal distance between x_1 and x_2 is computed by `line-length(x2, x1)`.
 - The vertical distance between y_2 and y_1 is computed by `line-length(y2, y1)`.
- The hypotenuse of a right triangle with legs the lengths of those distances is computed by:

$$\sqrt{\text{line-length}(x_2, x_1)^2 + \text{line-length}(y_2, y_1)^2}$$

- So, when we substitute these points in, the distance between them will be computed by:

$$\sqrt{\text{line-length}(4, 0)^2 + \text{line-length}(5, 2)^2}$$

2) The points are (0,2) and (4,5). Why aren't we using `line-length(0, 2)` and `line-length(4, 5)`?

3) Translate the expression above, for (0,2) and (4,5) into a Circle of Evaluation below.

Hint: In our programming language `num-sqr` is used for x^2 and `num-sqrt` is used for \sqrt{x}

4) Convert the Circle of Evaluation to Code below.

Circle of Evaluation

Code

**Computed distance
between (5, 0) and (1, 3)**

Graph

Distance From Game Coordinates

For each of the game screenshots, write the code to calculate the distance between the indicated characters. *The first one has been done for you.*

```
num-sqrt(num-sqr(line-length(600, 150)) + num-sqr(line-length(110, 300)))
```

Distance (px, py) to (cx, cy)

Directions: Use the Design Recipe to write a function `distance`, which takes in FOUR inputs: `px` and `py` (the x- and y-coordinate of the Player) and `cx` and `cy` (the x- and y-coordinates of another character), and produces the distance between them in pixels.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
 function name Domain Range

 what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
 function name input(s) what the function produces

_____ (_____) is _____
 function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
 function name variable(s)

_____ what the function does with those variable(s)

end

Comparing Code: Finding Missing Distances

For each of the game screenshots below, the math and the code for computing the covered distance is shown. Notice what is similar and what is different about how the top and bottom distances are calculated. Think about why those similarities and differences exist and record your thinking.

$$\sqrt{166^2 + 276^2}$$

```
num-sqrt(num-sqr(166) + num-sqr(276))
```

$$\sqrt{276^2 - 194^2}$$

```
num-sqrt(num-sqr(276) - num-sqr(194))
```

Distance

The Player is at (4, 2) and the Target is at (0, 5).

Distance takes in the player's x, player's y, character's x and character's y. Use the formula below to fill in the EXAMPLE:

$$\sqrt{(4-0)^2 + (2-5)^2}$$

Convert it into a Circle of Evaluation. (We've already gotten you started!)

Convert it to Pyret code.

Word Problem: distance

Directions: Write a function `distance`, which takes FOUR inputs: (1) `px`: The x-coordinate of the player, (2) `py`: The y-coordinate of the player, (3) `cx`: The x-coordinate of another game character, (4) `cy`: The y-coordinate of another game character. It should return the distance between the two, using the Distance formula: $\text{Distance}^2 = (px - cx)^2 + (py - cy)^2$

Contract and Purpose Statement

Every contract has three parts...

```
# _____ :: _____ -> _____  
# _____  
# _____ what does the function do?
```

Examples

Write some examples, then circle and label what changes...

examples:

```
_____ ( _____ ) is _____  
function name input(s) what the function produces  
_____ ( _____ ) is _____  
function name input(s) what the function produces
```

end

Definition

Write the definition, giving variable names to all your input values...

```
fun _____ ( _____ ):  
function name variable(s)  
_____ what the function does with those variable(s)
```

end

Word Problem: is-collision

Directions: Write a function `is-collision`, which takes FOUR inputs: (1) `px`: The x-coordinate of the player, (2) `py`: The y-coordinate of the player, (3) `cx`: The x-coordinate of another game character, (4) `cy`: The y-coordinate of another game character. It should return true if the coordinates of the player are within **50 pixels** of the coordinates of the other character. Otherwise, false.

Contract and Purpose Statement

Every contract has three parts...

```
# _____ :: _____ -> _____  
function name                               Domain                               Range  
  
# _____  
what does the function do?
```

Examples

Write some examples, then circle and label what changes...

examples:

```
_____ ( _____ ) is _____  
function name      input(s)                what the function produces  
  
_____ ( _____ ) is _____  
function name      input(s)                what the function produces
```

end

Definition

Write the definition, giving variable names to all your input values...

```
fun _____ ( _____ ):  
function name      variable(s)  
  
_____   
what the function does with those variable(s)
```

end

Directions:

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)

_____ what the function does with those variable(s)

end

Animation Data Worksheet

Decrease the cat's hunger level by 2 and sleep level by 1 on each tick.

Draw a sketch for three distinct moments of the animation

Sketch A	Sketch B	Sketch C

What things are changing?

Thing	Describe how it changes

What fields do you need to represent the things that change?

Field name (dangerX, score, playerIMG ...)	Datatype (Number, String, Image, Boolean ...)

Make a To-Do List, and check off each as "Done" when you finish each one.

Component	When is there work to be done?	To-Do	Done
Data Structure	<i>If any new field(s) were added, changed, or removed</i>	<input type="checkbox"/>	<input type="checkbox"/>
draw-state	<i>If something is displayed in a new way or position</i>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
next-state-tick	<i>If the Data Structure changed, or the animation happens automatically</i>	<input type="checkbox"/>	<input type="checkbox"/>
next-state-key	<i>If the Data Structure changed, or a keypress triggers the animation</i>	<input type="checkbox"/>	<input type="checkbox"/>

Component	<i>When is there work to be done?</i>	To-Do	Done
reactor	<i>If either next-state function is new</i>	<input type="checkbox"/>	<input type="checkbox"/>

Define the Data Structure

a _____ State is _____ data _____ State: | _____ (_____) end

Make a sample instance for each sketch from the previous page

_____ = _____ = _____ = _____ =

Write an example for one of the functions on the previous page

Contracts for Reactive

Contracts tell us how to use a function, by telling us three important things:

1. The **Name**
2. The **Domain** of the function - what kinds of inputs do we need to give the function, and how many?
3. The **Range** of the function - what kind of output will the function give us back?

For example: The contract `triangle :: (Number, String, String) -> Image` tells us that the name of the function is `triangle`, it needs three inputs (a `Number` and two `Strings`), and it produces an `Image`.

With these three pieces of information, we know that typing `triangle(20, "solid", "green")` will evaluate to an `Image`.

Name	Domain	Range
# above	:: (<u>Image</u> _{above} , <u>Image</u> _{below})	-> Image
<code>above(circle(10, "solid", "black"), square(50, "solid", "red"))</code>		
# beside	:: (<u>Image</u> _{left} , <u>Image</u> _{right})	-> Image
<code>beside(circle(10, "solid", "black"), square(50, "solid", "red"))</code>		
# circle	:: (<u>Number</u> _{radius} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
<code>circle(50, "solid", "purple")</code>		
# ellipse	:: (<u>Number</u> _{width} , <u>Number</u> _{height} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
<code>ellipse(100, 50, "outline", "orange")</code>		
# flip-horizontal	:: (<u>Image</u>)	-> Image
<code>flip-horizontal(text("Lion", 50, "maroon"))</code>		
# flip-vertical	:: (<u>Image</u>)	-> Image
<code>flip-vertical(text("Orion", 65, "teal"))</code>		
# isosceles-triangle	:: (<u>Number</u> _{size} , <u>Number</u> _{vertex-angle} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
<code>isosceles-triangle(50, 20, "solid", "grey")</code>		
# num-expt	:: (<u>Number</u> _{base} , <u>Number</u> _{power})	-> Number
<code>num-expt(3, 4) # three to the fourth power</code>		
# num-sqr	:: (<u>Number</u>)	-> Number
<code>num-sqr(4)</code>		
# num-sqrt	:: (<u>Number</u>)	-> Number
<code>num-sqrt(4)</code>		
# overlay	:: (<u>Image</u> _{top} , <u>Image</u> _{bottom})	-> Image
<code>overlay(circle(10, "solid", "black"), square(50, "solid", "red"))</code>		

Name	Domain	Range
# put-image	:: (<u>Image</u> _{front} , <u>Number</u> _{x-coordinate} , <u>Number</u> _{y-coordinate} , <u>Image</u> _{behind})	-> Image
	<i>put-image(circle(10, "solid", "black"), 10, 10, square(50, "solid", "red"))</i>	
# radial-star	:: (<u>Num</u> _{points} , <u>Num</u> _{outer} , <u>Num</u> _{inner} , <u>Str</u> _{fill-style} , <u>Str</u> _{color})	-> Image
	<i>radial-star(6, 20, 50, "solid", "red")</i>	
# rectangle	:: (<u>Number</u> _{width} , <u>Number</u> _{height} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
	<i>rectangle(100, 50, "outline", "green")</i>	
# regular-polygon	:: (<u>Number</u> _{size} , <u>Number</u> _{vertices} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
	<i>regular-polygon(25,5, "solid", "purple")</i>	
# rhombus	:: (<u>Number</u> _{size} , <u>Number</u> _{top-angle} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
	<i>rhombus(100, 45, "outline", "pink")</i>	
# right-triangle	:: (<u>Number</u> _{leg1} , <u>Number</u> _{leg2} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
	<i>right-triangle(50, 60, "outline", "blue")</i>	
# rotate	:: (<u>Number</u> _{degrees} , <u>Image</u> _{img})	-> Image
	<i>rotate(45, star(50, "solid", "dark-blue"))</i>	
# scale	:: (<u>Number</u> _{factor} , <u>Image</u> _{img})	-> Image
	<i>scale(1/2, star(50, "solid", "light-blue"))</i>	
# square	:: (<u>Number</u> _{size} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
	<i>square(50, "solid", "red")</i>	
# star	:: (<u>Number</u> _{radius} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
	<i>star(50, "solid", "red")</i>	
# star-polygon	:: (<u>Number</u> _{size} , <u>Number</u> _{point-count} , <u>Number</u> _{step-count} , <u>String</u> _{fill-style} , <u>String</u> _{color})	-> Image
	<i>star-polygon(100, 10, 3, "outline", "red")</i>	
# string-contains	:: (<u>String</u> _{haystack} , <u>String</u> _{needle})	-> Boolean
	<i>string-contains("hotdog", "dog")</i>	
# string-length	:: (<u>String</u>)	-> Number
	<i>string-length("rainbow")</i>	
# sum	:: (<u>Table</u> _{table-name} , <u>String</u> _{column})	-> Number
	<i>sum(animals-table, "pounds")</i>	
# text	:: (<u>String</u> _{message} , <u>Number</u> _{size} , <u>String</u> _{color})	-> Image
	<i>text("Zari", 85, "orange")</i>
