The Math Inside Video Games

- Video games are all about *change*: How fast is this character moving? How does the score change if the player collects a coin? Where on the screen should we draw a castle?
- We can break down a game into parts, and figure out which parts change and which ones stay the same. For example:
 - Computers use coordinates to position a character on the screen. These coordinates specify how far from the left (xcoordinate) and the bottom (y-coordinate) a character should be. Negative values can be used to "hide" a character, by positioning them somewhere off the screen.
 - When a character moves, those coordinates change by some amount. When the score goes up or down, it *also* changes by some amount.
- From the computer's point of view, the whole game is just a bunch of numbers that are changing according to some equations. We might not be able to see those equations, but we can definitely see the effect they have when a character jumps on a mushroom, flies on a dragon, or mines for rocks!
- Modern video games are *incredibly* complex, costing millions of dollars and several years to make, and relying on hundreds of programmers and digital artists to build them. But building even a simple game can give us a good idea of how the complex ones work!

Notice and Wonder

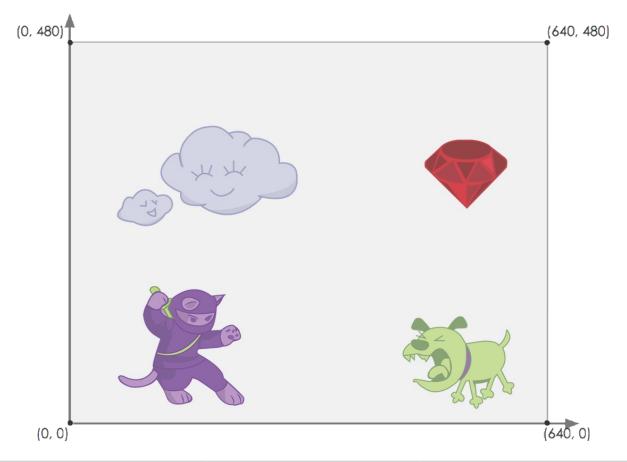

Write down what you notice and wonder about the Ninja Cat game screenshot.

"Notices" should be statements, not questions. What stood out to you? What do you remember?

What do you Notice?	What do you Wonder?

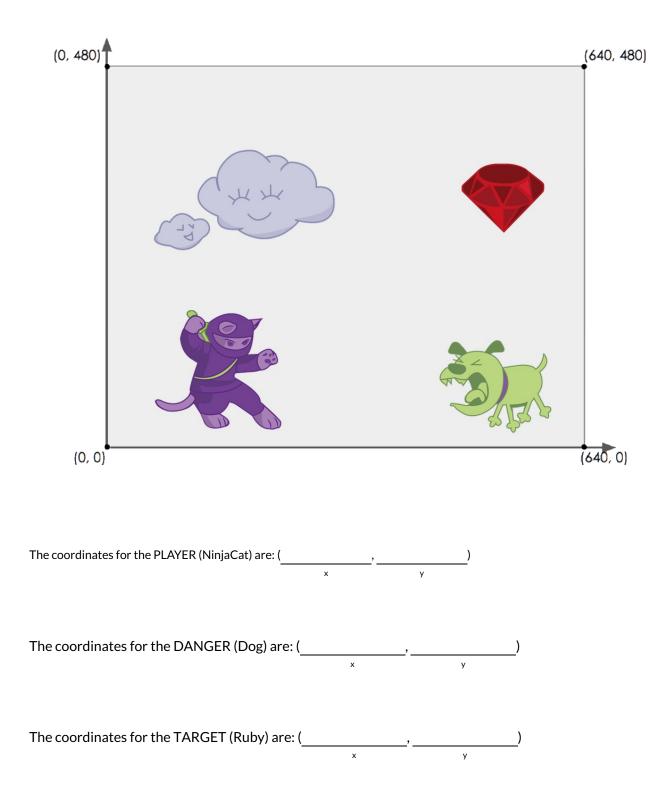

Reverse Engineer a Video Game

What is changing in the game? The first example is filled in for you.

Thing in the Game	What Changes About It?	More Specifically?
Dog	Position	x-coordinate

Estimating Coordinates

Notice and Wonder

As one partner explores the Ninja Cat Desmos graph, the other student will write down what they Notice. Students will then switch roles and, as one partner explores the Ninja Cat Desmos graph, the other student will write down what they Wonder.

What do you Notice?	What do you Wonder?

Brainstorm Your Own Game

Created by:

Background

Our game takes place:

In space? The desert? A mall?

Player

The Player is a

The Player moves only up and down.

Target

Your Player GAINS points when they hit The Target.

The Target is a

The Target moves only to the left or right.

Danger

Your Player LOSES points when they hit The Danger.

The Danger is a

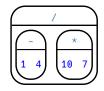

The Danger moves only to the left or right.

Artwork/Sketches/Proof of Concept

Draw a rectangle representing your game screen, and label the bottom-left corner as the coordinate (0,0). Then label the other four corners. Then, in the rectangle, sketch a picture of your game!

Order of Operations

Order of Operations is incredibly important when programming. To help us organize our math into something we can trust, we can *diagram* a math expression using the Circles of Evaluation. For example, the expression $1 - 4 \div 10 \times 7$ can be diagrammed as shown below.

To convert a **Circle of Evaluation** into code, we walk through the circle from outside-in, moving left-to-right. We type an open parenthesis when we *start* a circle, and a close parenthesis when we *end* one. Once we're in a circle, we write whatever is on the left of the circle, then the **operation** at the top, and then whatever is on the right. The circle above, for example, would be programmed as (1 - 4) / (10 * 7).

Notice and Wonder

Try typing numbers into the Interactions Area, hitting "Enter", and see what you get back! Some ideas:

- 1. What is the largest number you can enter? The smallest?
- 2. Can you write decimals? Fractions?
- 3. After you get back a decimal, try clicking on it. What happens?
- 4. Can you write negative numbers? Negative fractions?
- 5. What else can you try?

What do you Notice?	What do you Wonder?

Completing Circles of Evaluation from Arithmetic Expressions

Introduction to Programming

The **Editor** is a software program we use to write Code. Our Editor allows us to experiment with Code on the right-hand side, in the **Interactions Area**. For Code that we want to *keep*, we can put it on the left-hand side in the **Definitions Area**. Clicking the "Run" button causes the computer to re-read everything in the Definitions Area and erase anything that was typed into the Interactions Area.

Data Types

Programming languages involve different data types, such as Numbers, Strings, Booleans, and even Images.

- Numbers are values like 1, 0.4, 1/3, and -8261.003.
 - Numbers are usually used for quantitative data and other values are usually used as categorical data.
 - In Pyret, any decimal must start with a 0. For example, 0.22 is valid, but .22 is not.
- Strings are values like "Emma", "Rosanna", "Jen and Ed", or even "08/28/1980".
 - All strings *must* be surrounded in quotation marks.
- Booleans are either true or false.

All values evaluate to themselves. The program 42 will evaluate to 42, the String "Hello" will evaluate to "Hello", and the Boolean false will evaluate to false.

Operators

Operators (like + , - , * , < , etc.) work the same way in Pyret that they do in math.

- Operators are written between values, for example: 4 + 2.
- In Pyret, operators must always have a space around them. 4 + 2 is valid, but 4+2 is not.
- If an expression has different operators, parentheses must be used to show order of operations. 4 + 2 + 6 and
 - 4 + (2 * 6) are valid, but 4 + 2 * 6 is not.

Applying Functions

Applying functions works much the way it does in math. Every function has a name, takes some inputs, and produces some output. The function name is written first, followed by a list of *arguments* in parentheses.

- In math this could look like f(5) or g(10,4).
- In Pyret, these examples would be written as f(5) and g(10, 4).
- Applying a function to make images would look like star(50, "solid", "red").
- There are many other functions, for example num-sqr, num-sqrt, triangle, square, string-repeat, etc.

Functions have contracts, which help explain how a function should be used. Every contract has three parts:

- The Name of the function literally, what it's called.
- The Domain of the function what types of values the function consumes, and in what order.
- The Range of the function what type of value the function produces.

Numbers and Strings

Make sure you've loaded the code.pyret.org, (CPO) editor, clicked "Run", and are working in the Interactions Area.

Numbers

1) Try typing 42 into the Interactions Area and hitting "Enter". What is the largest number the editor can handle?

2) Try typing 0.5. Then try typing .5. Then try clicking on the answer. Experiment with other decimals. Explain what you understand about how decimals work in this programming language.

3) What happens if you try a fraction like 1/3?

4) Try writing negative integers, fractions and decimals.

Strings

String values are always in quotes.

5) Is 42 the same as "42" ? Why or why not? Write your answer below:

6) Try typing your name (in quotes!).

7) Try typing a sentence like "I'm excited to learn to code!" (in quotes!).

8) Try typing your name with the opening quote, but without the closing quote. Read the error message!

9) Now try typing your name *without any quotes*. Read the error message!

10) Explain what you understand about how strings work in this programming language.

Operators

11) Just like math, Pyret has *operators* like +, -, * and /. Try typing in 4 + 2, and then 4+2 (without the spaces). What can you conclude from this?

12) Type in the following expressions, one at a time: 4 + 2 + 6, 4 + 2 * 6, 4 + (2 * 6). What do you notice?

13) Try typing in 4 + "cat", and then "dog" + "cat". What can you conclude from this?

Booleans

Boolean-producing expressions are yes-or-no questions and will always evaluate to either true ("yes") or false ("no"). What will each of the expressions below evaluate to? Write down your prediction in the blanks provided and then type the code into the interactions area to see what it returns.

		Computer			Computer
	Prediction:	Returns:		Prediction:	Returns:
1) 3 <= 4			2)"a" > "b"		
3) 3 == 2			4)"a" < "b"		
5) 2 < 4			6)"a" == "b"		
7) 5 >= 5			8)"a" <> "a"		
9) 4 >= 6			10)"a" >= "a"		
11) 3 <> 3			12)"a" <> "b"		
13) In your own words,	describe what	< does.			
13/ III your Own worus,	uesci ine wilat	< uces.			

14) In your own words, describe what $\geq =$ does.

15) In your own words, describe what <> does.

	Prediction:	Computer Returns:
<pre>16) string-contains("catnap", "cat")</pre>		
<pre>17) string-contains("cat", "catnap")</pre>		
18) How many Numbers are there in the entire universe?		
19) How many Strings are there in the entire universe?		
20) How many Images are there in the entire universe?		
21) How many Booleans are there in the entire universe?		

Applying Functions

Type this line of code into the interactions area and hit "Enter":

triangle(50, "solid", "red")

	Catching Bugs	
4	What data type does the triangle function produce? (Numbers? Strings? Booleans?)	
3	How many arguments does triangle expect?	
2	What did the expression evaluate to?	
1	What is the name of this function?	

The following lines of code are all BUGGY! Read the code and the error messages to identify the mistake.

5) triangle(20, "solid" "red")

Pyret didn't understand your program around triangle(20, "solid" **"red"**)

Can you spot the mistake?

```
6) triangle(20, "solid")
```

This application expression errored:

triangle(20, "solid")

<u>2 arguments</u> were passed to the **operator**. The **operator** evaluated to a function accepting 3 parameters. An <u>application expression</u> expects the number of parameters and <u>arguments</u> to be the same.

Can you spot the mistake?

```
7) triangle(20, 10, "solid", "red")
```

This application expression errored:

```
triangle (20, 10, "solid", "red")`
```

<u>*4 arguments*</u> were passed to the <u>operator</u>. The <u>operator</u> evaluated to a function accepting 3 parameters. An <u>application expression</u> expects the number of parameters and <u>arguments</u> to be the same.

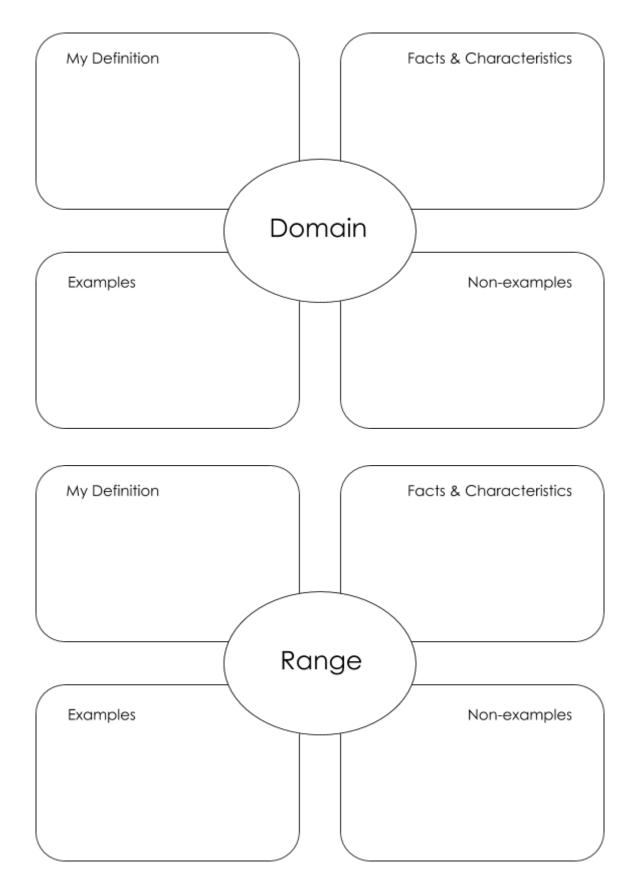

Can you spot the mistake?

8) triangle (20, "solid", "red")

Pyret thinks this code is probably a function call:triangle (20, "solid", "red")Function calls must not have space between the <u>function expression</u> and the <u>arguments</u>.

```
Can you spot the mistake?
```

Domain and Range

Practicing Contracts: Domain & Range

Consider the following contract:

is-beach-weather :: Number, String -> Boolean

What is the Name of this function?
 How many arguments are in this function's Domain?
 What is the type of this function's first argument?
 What is the type of this function's second argument?
 What is the Range of this function?

6) Circle the expression below that shows the correct application of this function, based on its contract.

A. is-beach-weather(70, 90)

B. is-beach-weather(80, 100, "cloudy")

C. is-beach-weather("sunny", 90)

D.	is-beach-weather	(90,	"stormy	weather")
----	------------------	------	---------	----------	---

Consider the following contract:

cylinder :: Number, Number, String -> Image

7) What is the **Name** of this function?

8) How may arguments are in this function's Domain ?	
9) What is the type of this function's first argument ?	
10) What is the type of this function's second argumen	t?
11) What is the type of this function's third argument ?	
12) What is the Range of this function?	

13) Circle the expression below that shows the correct application of this function, based on its contract.

A. cylinder("red", 10, 60)

- B. cylinder(30, "green")
- C. cylinder(10, 25, "blue")
- D. cylinder(14, "orange", 25)

Matching Expressions and Contracts

Match the contract (left) with the expression described by the function being used (right).

	Contract	Expression
<pre># make-id :: String, Number</pre>	-> Image 1	A make-id("Savannah", "Lopez", 32)
<pre># make-id :: String, Number, String</pre>	-> Image 2	<pre>B make-id("Pilar", 17)</pre>
<pre># make-id :: String</pre>	-> Image 3	C make-id("Akemi", 39, "red")
<pre># make-id :: String, String</pre>	-> Image 4	D make-id("Raïssa", "McCracken")
<pre># make-id :: String, String, Number</pre>	-> Image 5	E make-id("von Einsiedel")

Contract		Expression
<pre># is-capital :: String, String -> Boolean</pre>	6 A	A show-pop("Juneau", "AK", 31848)
<pre># is-capital :: String, String, String -> Boolean</pre>	7 B	show-pop("San Juan", 395426)
<pre># show-pop :: String, Number -> Image</pre>	8 C	is-capital("Accra", "Ghana")
<pre># show-pop :: String, String, Number -> Image</pre>	9 D) show-pop(3751351, "Oklahoma")
<pre># show-pop :: Number, String -> Number</pre>	10 E	is-capital("Albany", "NY", "USA")

Using Contracts

Use the contracts to write expressions to generate images similar to those pictured.

ellipse :	: Number,	Number,	String,	String	->	Image
-----------	-----------	---------	---------	--------	----	-------

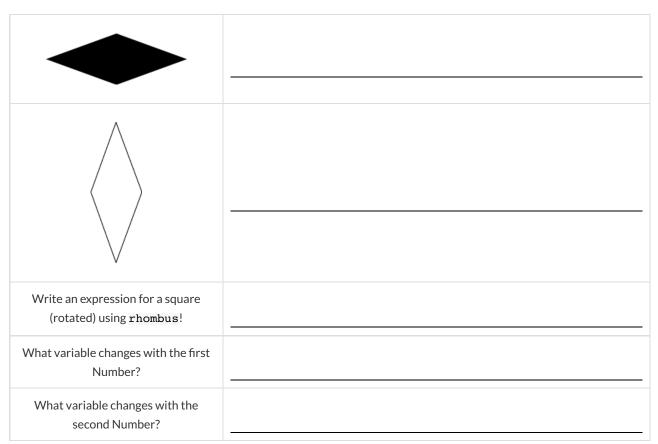

regular-polygon :: Number, Number, String, String -> Image

What changes with the first Number?	
What about the shape changes with the second Number?	
Use regular-polygon to write an expression for a square!	
How would you describe a regular polygon to a friend?	

Using Contracts (continued)

Use the contracts to write expressions to generate images similar to those pictured.

rhombus :: Number, Number, String, String -> Image

Triangle Contracts

1) What kind of triangle does the triangle function produce?

There are lots of other kinds of triangles! And Pyret has lots of other functions that make triangles!

- triangle :: Number, String, String -> Image
- right-triangle :: Number, Number, String, String -> Image
- isosceles-triangle :: Number, Number, String, String -> Image

triangle-sas :: Number, Number, Number, String, String -> Image

2) Why do you think triangle only needs one number, while right-triangle and isosceles-triangle need two numbers and triangle-sas needs three?

3) Write right-triangle expressions for the images below. One argument for each should be 100.

4) What do you think the numbers in right-triangle represent?

5) Write isosceles-triangle expressions for the images below. 1 argument for each should be 100.

6) What do you think the numbers in isosceles-triangle represent?

7) Write 2 expressions that would build **right-isosceles** triangles. Use right-triangle for one expression and isosceles-triangle for the other expression.

Radial Star

radial-star :: (

```
points :: Number,
inner-radius :: Number,
full-radius :: Number,
style :: String,
color :: String
) -> Image
```

Using the detailed contract above, match each image to the expression that describes it.

Image			Expression
*	1	A	<pre>radial-star(5, 50, 200, "outline", "black")</pre>
\star	2	В	radial-star(7, 100, 200, "solid", "black")
	3	с	radial-star(7, 100, 200, "outline", "black")
•	4	D	radial-star(10, 150, 200, "solid", "black")
M X	5	E	radial-star(10, 20, 200, "solid", "black")
*	6	F	radial-star(100, 20, 200, "solid", "black")
*	7	G	radial-star(100, 100, 200, "outline", "black")

What's on your mind?

Diagramming Function Composition

f :: Number -> Number	g :: Number -> Number	h :: Number -> Number
Consumes a number,	Consumes a number, adds	Consumes a number,
multiplies by 3 to produce	six to produce the result	subtracts one to produce
the result		the result
f(x) = 3x	g(x)=x+6	h(x)=x-1

For each function composition diagrammed below, translate it into the equivalent Circle of Evaluation for Order of Operations. Then write expressions for *both* versions of the Circles of Evaluation, and evaluate them for x = 4. The first one has been completed for you.

Function Composition	Order of Operations	Trans	late & Evaluate
(1)		Composition:	h(g(f(x)))
g	$\begin{pmatrix} + \\ \hline \star & 6 \end{pmatrix}$ 1	Operations:	((3 * x) + 6) - 1
(f) x		Evaluate for x = 4	h(g(f(4))) = 27
(2 (g)		Composition:	
f		Operations:	
		Evaluate for x = 4	
(3 (h)		Composition:	
f		Operations:	
		Evaluate for x = 4	
(4		Composition:	
h		Operations:	
		Evaluate for x = 4	

Function Composition — Green Star

1) Draw a Circle of Evaluation and write the Code for a **solid**, **green star**, **size 50**. **Circle of Evaluation**:

Code: _____

Using the star described above as the	original, draw the Circ	les of Evaluation and wri	te the Code for each exerc	cise below.

2 A solid, green star, that is triple the size of the original (using scale) Circle of Evaluation:	3 A solid, green star, that is half the size of the original (using scale) Circle of Evaluation:
Code:	Code:
4 A solid, green star of size 50 that has been rotated 45 degrees counter-clockwise Circle of Evaluation:	5 A solid, green star that is 3 times the size of the original and has been rotated 45 degrees Circle of Evaluation:
Code:	Code:

Function Composition — Your Name

You'll be investigating these functions with your partner:

text :: String, Number, String -> Image

flip-horizontal :: Image -> Image
flip-vertical :: Image -> Image

frame :: Image -> Image
above :: Image, Image -> Image
beside :: Image, Image -> Image

1) In the editor, write the code to make an image of your name in big letters in a color of your choosing using text. Then draw the Circle of Evaluation and write the Code that will create the image.

Circle of Evaluation:

Code:

Using the "image of your name" described above as the **original**, draw the Circles of Evaluation and write the Code for each exercise below. Test your ideas in the editor to make sure they work.

2 The framed "image of your name".	3 The "image of your name" flipped vertically.
Circle of Evaluation:	Circle of Evaluation:
Code:	Code:
4 The "image of your name" above "the image of your	5 The "image of your name" flipped horizontally beside
name" flipped vertically.	"the image of your name".
Circle of Evaluation:	Circle of Evaluation:
Code:	Code:

Function Composition — scale-xy

You'll be investigating these two functions with your partner:

scale-xy :: Number, Number, Image -> Image

overlay :: Image, Images -> Image

The Image:	Circle of Evaluation:	Code:
	rhombus 40 90 "solid" "purple"	<pre>rhombus(40, 90, "solid", "purple")</pre>

Starting with the image described above, write the Circles of Evaluation and Code for each exercise below. Be sure to test your code in the editor!

1 A purple rhombus that is stretched 4 times as wide.	2 A purple rhombus that is stretched 4 times as tall
Circle of Evaluation:	Circle of Evaluation:
Code:	Code:
3 The tall rhombus overlayed on the wide rhombus.	★: Overlay a red rhombus onto the last image you made.
Circle of Evaluation:	Circle of Evaluation:
Code:	Code:

<pre>beside(rectangle(200, 100, "solid", "black"), square(100, "solid", "black")) scala=2y(1, 2, square(100, 'solid", "black")) scala=2y(1, 2, square(100, 'solid", "black")) scala=2y(1, 2, square(100, 'solid", "black")) scala=2y(1, 2, sectangle(100, 10, "solid", "black")) scala=2y(1, 2, solid", "black"), scala=2y(10, 50, "solid", "black")) Per Antimage below (dentify 2 expressions that could be used to compose it. Defining Values

In math, we use values like -98.1, 2/3 and 42. In math, we also use expressions like 1×3 , $\sqrt{16}$, and 5 - 2. These evaluate to results, and typing any of them in as code produces some answer.

Math also has **definitions**. These are different from values and expressions, because they *they do not produce results*. Instead, they simply create names for values, so that those names can be re-used to make the Math simpler and more efficient.

Definitions always have both a name and an expression. The name goes on the left and the value-producing expression goes on the right, separated by an equals sign:

$$egin{array}{ll} x=4 \ y=9+x \end{array}$$

The name is defined to be the result of evaluating the expression. Using the above examples, we get "x is defined to be 4, and y is defined to be 13". **Important: there is no "answer" to a definition**, and typing in a definition as code will produce no result.

Notice that *definitions can refer to previous definitions*. In the example above, the definition of y refers to x. But x, on the other hand, *cannot* refer to y. Once a value has been defined, it can be used in later expressions.

In Pyret, these definitions are written the exact same way :

Try typing these definitions into the Definitions Area on the left, clicking "Run", and then *using* them in the Interactions Area on the right.

x = 4y = 9 + x

Just like in math, definitions in our programming language can only refer to previously-defined values.

Here are a few more value definitions. Feel free to type them in, and make sure you understand them.

```
x = 5 + 1
y = x * 7
food = "Pizza!"
dot = circle(y, "solid", "red")
```

Defining Values - Explore

Open the Defining Values Starter File and click run. 1) What do you notice?

2) What do you wonder?

Look at the expressions listed below. Think about what you expect each of them to produce. Then, test them out one at a time in the Interactions Area.

- x
- x + 5
- y 9
- x * y
- •z
- t
- gold-star
- my-name
- swamp
- c

3) What have you learned about defining values?

4) Define at least 2 more variables in the definitions area, click run and test them out. Once you know they're working, record the code you used below.

Defining Values - Chinese Flag

1) What image do you see repeated in the flag?

2) Highlight or circle all instances of the structure that makes the repeated image in the code below.

3) In the code below, highlight or circle all instances of the expression for that image.

```
put-image(
    rotate(40, star(15, "solid", "yellow")),
    120, 175,
    put-image(
        rotate(80, star(15, "solid", "yellow")),
        140, 150,
        put-image(
        rotate(60, star(15, "solid", "yellow")),
        140, 120,
        put-image(
        rotate(40, star(15, "solid", "yellow")),
        120, 90,
        put-image(scale(3, star(15, "solid", "yellow")),
        60, 140,
        rectangle(300, 200, "solid", "red"))))))
```

4) Write the code to define a value for the repeated expression.

5) Open the Chinese flag starter file (Pyret) and click Run.

Then type china into the interactions area and click Enter.

6) **Save a copy** of the file, and simplify the flag code using the value you defined. Click Run, and confirm that you still get the same image as the original.

7) Now change the color of all of the stars to black, in both files. Then change the size of the stars.

8) Why is it helpful to define values for repeated images?

Challenge:

- This file uses a function we haven't seen before! What is it?
- Can you figure out its contract? Hint: Focus on the last instance of the function.

Why Define Values?

1) Complete the table using the first row as an example.

2) Write the code to define the value of sun.

Original Circle of Evaluation & Code	Ť	Use the <i>defined value</i> sun to simplify!
3 radial-star 30 20 50 "solid" "yellow"	Ť	scale 3 sun
Code: scale(3, radial-star(30, 20, 50, "solid", "yellow"))	Ť	Code: scale(3, sun)
frame radial-star 30 20 50 "solid" "yellow"	Î	
Code: frame(radial-star(30, 20, 50, "solid", "yellow"))	Ť	Code:
text "sun" 30 "black" 30 20 50 "solid" "yellow"	t	
Code: overlay(text("sun", 30, "black"), radial-star(30, 20, 50, "solid", "yellow"))	Ť	Code:
2) Toot voir ondo in the editor and male area it and uncertainty of the too and it to		

3) Test your code in the editor and make sure it produces what you would expect it to.

Which Value(s) Would it Make Sense to Define?

For each of the images below, identify which element(s) you would want to define before writing code to compose the image. Hint: what gets repeated?

Writing Code using Defined Values

1) On the line below, write the Code to define PRIZE-STAR as a pink, outline star of size 65.

Using the PRIZE-STAR definition from above, draw the Circle of Evaluation and write the Code for each of the exercises. One Circle of Evaluation has been done for you.

2The outline of a pink star that is three times the size of the original (using scale)	3 The outline of a pink star that is half the size of the original (using $scale$)
Circle of Evaluation:	Circle of Evaluation:
3 PRIZE-STAR	
Code:	Code:
4 The outline of a pink star that is rotated 45 degrees (It should be the same size as the original.)	5 The outline of a pink star that is three times as big as the original and has been rotated 45 degrees
Circle of Evaluation:	Circle of Evaluation:
Code:	Code:

6) How does defining values help you as a programmer?

Estimating Coordinates

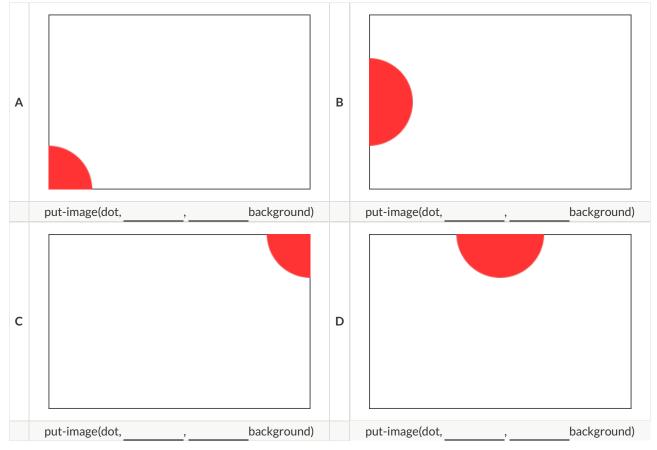

Think of the background image as a sheet of graph paper with the origin (0,0) in the bottom left corner. The numbers in put-image specify a point on that graph paper, where the center of the top image should be placed.

The width of the rectangle is 300 and the height is 200. The definitions for dot and background are:

```
dot = circle(50, "solid", "red")
```

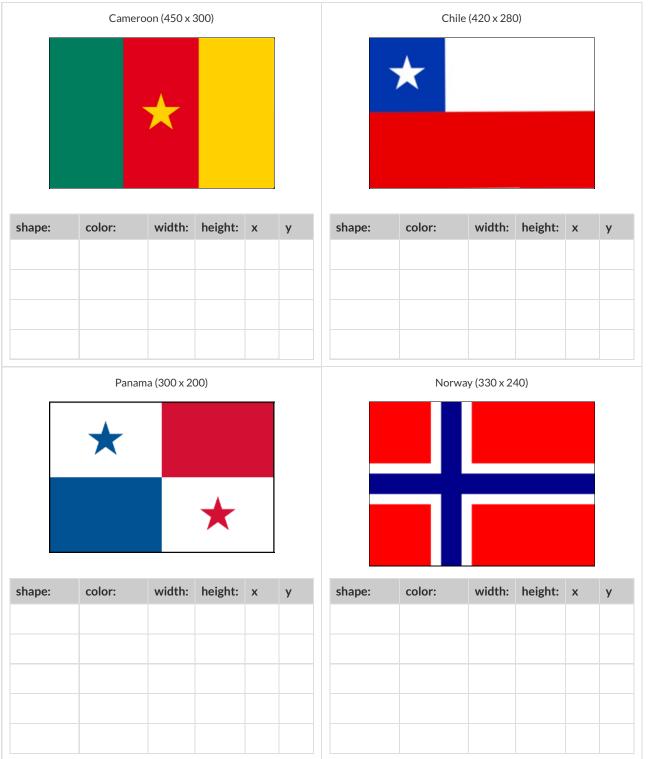

background = rectangle(300, 200, "outline", "black")

Estimate: What coordinates for the dot would create each of the following images?

Decomposing Flags

Each of the flags below is shown with their width and height. Identify the shapes that make up each flag. Use the flag's dimensions to estimate the dimensions of the different shapes. Then estimate the x and y coordinates for the point at which the center of each shape should be located on the flag. *Hint: The bottom left corner of each flag is at (0,0) and the top right corner is given by the flags dimensions*.

Notice and Wonder

As you investigate the Game Starter File with your partner, record what you Notice, and then what you Wonder.

Remember, "Notices" are statements, not questions.

What do you Notice?	What do you Wonder?

Defining Functions

Functions can be viewed in *multiple representations*. You already know one of them: *Contracts*, which specify the Name, Domain, and Range of a function. Contracts are a way of thinking of functions as a *mapping* between one set of data and another. For example, a mapping from Numbers to Strings:

```
f :: Number -> String
```

Another way to view functions is with *Examples*. Examples are essentially input-output tables, showing what the function would do for a specific input:

In our programming langauge, we focus on the last two columns and write them as code:

examples: f(1) is 1 + 2 f(2) is 2 + 2 f(3) is 3 + 2 f(4) is 4 + 2 end

Finally, we write a formal function definition ourselves. The pattern in the Examples becomes *abstract* (or "general"), replacing the inputs with *variables*. In the example below, the same definition is written in both math and code: f(x) = x + 2fun f(x): x + 2 end

Look for connections between these three representations!

- The function name is always the same, whether looking at the Contract, Examples, or Definition.
- The number of inputs in the Examples is always the same as the number of types in the Domain, which is always the same as the number of variables in the Definition.
- The "what the function does" pattern in the Examples is almost the same in the Definition, but with specific inputs replaced by variables.

Matching Examples and Definitions (Math)

Look at each set of examples on the left and circle what is changing from one example to the next.

Then, *match* the examples on the left to the contracts that describe them.

$\begin{array}{c cccc} x & f(x) \\ 1 & 2 \times 1 \\ 2 & 2 \times 2 \\ 3 & 2 \times 3 \end{array} & 1 & A f(x) = x - 3 \\ \hline x & f(x) \\ 15 & 15 - 3 \\ 25 & 25 - 3 \\ 35 & 35 - 3 \end{array} & 2 & B f(x) = 2x \\ \hline x & f(x) \\ 10 & 10 + 2 \\ 15 & 15 + 2 \\ 20 & 20 + 2 \end{array} & 3 & C f(x) = 2x + 1 \\ \hline x & f(x) \\ 0 & 3(0) - 2 \\ 1 & 3(1) - 2 \\ 2 & 3(2) - 2 \end{array} & 4 & D f(x) = 3x - 2 \\ \hline x & f(x) \\ 10 & 2(10) + 1 \\ 20 & 2(30) + 1 \end{array} & 5 & E f(x) = x + 2 \\ \hline \end{array}$	Example	25:		Functions:

Matching Examples and Function Definitions

```
Highlight the variables in gt and label them with the word "size".
examples:
  gt(20) is
    triangle(20, "solid", "green")
end
examples:
  gt(45) is
    triangle(45, "solid", "green")
end
fun gt(size): triangle(size, "solid", "green") end
```

Highlight and label the variables in the example lists below. Then, using gt as a model, match the examples to their corresponding function definitions.

Examples		Definition
<pre>examples: f(30) is circle(8, "solid", "red") f(10) is circle(8, "outline", "red") end</pre>	1	<pre>fun f(s): star(s, "outline", "red") A end</pre>
examples: f(2) is 2 + 2 f(4) is 4 + 4 f(5) is 5 + 5 end	2	B fun f(num): num + num end
<pre>examples: f("red") is circle(7, "solid", "red") f("orange") is circle(7, "solid", "teal") end</pre>	3	C fun f(c): star(9, "solid", c) end
<pre>examples: f("red") is star(9, "solid", "red") f("grey") is star(9, "solid", "grey") f("pink") is star(9, "solid", "pink") end</pre>	4	<pre>D fun f(r): circle(8, s, "red") end</pre>

Match each set of examples (left) with the contract that best describes it(right).			
Examples			Contract
<pre>examples: f(5) is 5 / 2 f(9) is 9 / 2 f(24) is 24 / 2 end</pre>	4	A	# f :: Number -> Number
<pre>examples: f(1) is f(1) is rectangle(1, 1, "outline", "red") f(6) is rectangle(6, 6, "outline", "red") end</pre>	Ν	۵	# f :: String -> Image
<pre>examples: f("pink", 5) is star(5, "solid", "pink") f("blue", 8) is star(8, "solid", "blue") end</pre>	m	υ	# f :: Number -> Image
<pre>examples: f("Hi!") is text("Hi!", 50, "red") f("Ciao!") is text("Ciao!", 50, "red") end</pre>	4	۵	#f :: Number, String -> Image
<pre>examples: f(5, "outline") is star(5, "outline", "yellow") f(5, "solid") is star(5, "solid", "yellow") end</pre>	N	ш	# f :: String, Number -> Image

Matching Examples and Contracts

Contracts, Examples & Definitions

gt

Directions : Define a function called gt , which makes solid green triangles of whatever size we want.

Every	contract has the	ree part	s						
#	gt :	:			Nun	nber		->	Image
	function name				do	main			range
Write	e some examples,	then ci	rcle and label wh	nat char	nges.				
exan	mples:								
	gt	(10)	is	triangle(10,	"solid",	"green")
	function name		input(s)			what	the function produ	ces	
	gt	(20)	is	triangle(20,	"solid",	"green")
end	function name		input(s)			what	the function produ	ces	
Write	e the definition, g	iving va	riable names to	all your	inpu	ıt values			
fun	gt	(size):					
	function name		variable(s)						
tr	iangle(size	, "so	olid", "gre	en")					
end			W	hat the fu	nction	does with those variable	e(s)		

bc

Directions : Define a function called bc , which makes solid blue circles of whatever radius we want.

Every	<mark>contract has th</mark>	ree parts	·					
#		::					->	
	function name				domain		range	•
Write	e some examples	s, then cir	cle and label who	at cha	nges			
exan	ples:							
		()) is			
	function name		input(s)			what the function produces	;	
		()) is			
end	function name		input(s)			what the function produces	;	
Write	the definition,	giving va	riable names to a	ıll you	r input valu	25		
fun		():				
	function name	; ;	variable(s)					

end

What's on your mind?

Solving Word Problems

Being able to see functions as Contracts, Examples or Definitions is like having three powerful tools. These representations can be used together to solve word problems!

1) When reading a word problem, the first step is to figure out the **Contract** for the function you want to build. Remember, a Contract must include the Name, Domain and Range for the function!

2) Then we write a **Purpose Statement**, which is a short note that tells us what the function *should do*. Professional programmers work hard to write good purpose statements, so that other people can understand the code they wrote!

3) Next, we write at least two **Examples**. These are lines of code that show what the function should do for a *specific* input. Once we see examples of at least two inputs, we can *find a pattern* and see which parts are changing and which parts aren't.

4) To finish the Examples, we circle the parts that are changing, and label them with a short variable name that explains what they do.

5) Finally, we define the function itself! This is pretty easy after you have some examples to work from: we copy everything that didn't change, and replace the changeable stuff with the variable name!

Creating Contracts From Examples

Write the contracts used to create each of the following collections of examples.

1)

```
examples:
    big-triangle(100, "red") is
    triangle(100, "solid", "red")
    big-triangle(200, "orange") is
    triangle(200, "solid", "orange")
end
```

2)

```
examples:
   purple-square(15) is
    rectangle(15, 15, "outline", "purple")
   purple-square(6) is
    rectangle(6, 6, "outline", "purple")
end
```

3)

```
examples:
   banner("Game Today!") is
    text("Game Today!", 50, "red")
   banner("Go Team!") is
    text("Go Team!", 50, "red")
   banner("Exit") is
    text("Exit", 50, "red")
end
```

4)

```
examples:
   twinkle("outline", "red") is
     star(5, "outline", "red")
   twinkle("solid", "pink") is
     star(5, "solid", "pink")
   twinkle("outline", "grey") is
     star(5, "outline", "grey")
end
```

5)

examples: half(5) is 5 / 2 half(8) is 8 / 2 half(900) is 900 / 2 end

Writing Examples from Purpose Statements

We've provided contracts and purpose statements to describe four different functions. Write examples for each of those functions.

Сс	ontract and Purpose	Statement					
Ever	y contract has three parts.						
#	upside-down::		Image	9	->	Image	
	function name		domain			range	
#Co	onsumes an image,	and flips it upside dow	vn by ro	tating it 180 degrees.			
_			what does th	ne function do?			_
Ex	amples						
Writ	e some examples, then circ	cle and label what changes					
exa	mples:						
	() is			
	function name	input(s)					
			what the f	function produces			
	() is			
	function name	input(s)		_			
				5			
end	l		what the t	function produces			
_							
Co	ontract and Purpose	Statement					
Ever	y contract has three parts.						
# pi	roduct-squared::	N	umber,	Number	->	Number	_
	function name		dom	ain		range	
# Co	onsumes two numb	ers and squares their p	product				
_			what does th	ne function do?			
Ex	amples						
Writ	e some examples, then circ	cle and label what changes					
exa	mples:						
		() is				
	function name	input(s)		what the function	on produces		
		() is				
_	function name	input(s)		what the function	on produces		

end

Word Problem: rocket-height

Directions : A rocket blasts off, traveling at 7 meters per second. Use the Design Recipe to write a function

roc	ket-height	, which t	akes in a numbe	er of seconds and	l calculates the height.		
Cor	ntract and Purp	oose Sta	tement				
Every	contract has three	parts					
#		::				->	
#	function name			domain		rang	je
				what does the f	unction do?		
Exa	mples

Problem Decomposition

- Sometimes a problem is too complicated to solve all at once. Maybe there are too many variables, or there is just so much information that we can't get a handle on it!
- We can use **Problem Decomposition** to break those problems down into simpler pieces, and then work with the pieces to solve the whole. There are two strategies we can use for decomposition:
 - **Top-Down** Start with the "big picture", writing functions or equations that describe the connections between parts of the problem. Then, work on defining those parts.
 - **Bottom-Up** Start with the smaller parts, writing functions or equations that describe the parts we understand. Then, connect those parts together to solve the whole problem.
- You may find that one strategy works better for some types of problems than another, so make sure you're comfortable using either one!

The Design Recipe: Revenue & Cost

Directions: Use the Design Recipe to write a function revenue, which takes in the number of glasses sold at \$1.75 apiece and calculates the total revenue.

Contract and Purpose Statement	
Every contract has three parts	
# :: ->

Inequalities

- Sometimes we want to *ask questions* about data. For example, is x greater than y ? Is one string equal to another? These questions can't be answered with a Numbers. Instead, they are answered with a new data type called a **Boolean**.
- Video games use Booleans for many things: asking when a player's health is equal to zero, whether two characters are close enough to bump into one another, or if a character's coordinates put it off the edge of the screen.
- A Boolean value is either true or false. Unlike Numbers, Strings, and Images, Booleans have only two possible values.
- You already know some functions that produce Booleans, such as < and > ! Our programming language has them, too: 3 < 4, 10 > 2, and -10 == 19.
- We also have ways of writing **Compound Inequalities**, so we can ask more complicated questions using the and and or functions.
 - \circ (3 > 4) and (10 < 2) translates to "three is less than four *and* ten is less than two". This will evaluate to false, since the and function requires that both sub-expressions be true.
 - \circ (3 > 4) or (10 < 2), which translates to "three is less than four *or* ten is less than two". This will evaluate to true, since the or function only requires that one sub-expression be true.
- The Circles of Evaluation work the same way with Booleans that they do with Numbers, Strings and Images:

Boolean Functions

Explore the functions in the Booleans Starter File. What characteristics define them as Booleans?

Fill in the blanks below so that each of the five functions returns true					
1) is-odd()					
2) is-even()					
3) is-less-than-one()					
4) is-continent()					
5) is-primary-color()					
Fill in the blanks below so that each of the five functions returns false					
6) is-odd()					
7) is-even()					
8) is-less-than-one()					
9) is-continent()					
10) is-primary-color()					

Simple Inequalities

Each inequality expression in the first column contains a number.

Decide whether or not that number is a solution to the expression and place it in the appropriate column.

Then identify 4 solution and 4 non-solution values for \mathbf{x} .

- Solutions will make the expression true .
- Non-Solutions will make the expression false .

Challenge yourself to use negatives, positives, fractions, decimals, etc. for your x values.

Expression	4 solutions that evaluate to true	4 non-solutions that evaluate to false
x > 2		
x <= -2		
x < 3.5		
x >= -1		
x > -4		
x <> 2		

1) For which inequalities was the number from the expression part of the solution?

2) For which inequalities was the number from the expression not part of the solution?

3) For which inequalities were the solutions on the left end of the number line?

4) For which inequalities were the solutions on the right end of the number line?

Converting Circles of Evaluation to Code

	Circle of Evaluation on the left-hand side, write the code	Code
1	> (+ (4) (5) (9) (4) (5) (9) (4) (5) (9) (4) (5) (9) (4) (5) (9) (4) (5) (9) (4) (5) (9) (4) (5) (9) (4) (5) (7) (7) (7) (7) (7) (7) (7) (7) (7) (7	
2	and < < 5 10 10 15	
3	or == yum "apple" == yum "banana"	
4	>= String-length "My Game"	
5	$ \begin{array}{ c c c c c c c c c c c c c c c c c c c$	

For each Circle of Evaluation on the left-hand side, write the code for the Circle on the right-hand side

Compound Inequalities — Practice

Create the Circles of Evaluation, then convert the expressions into code in the space provided.

1) 2 is less than 5, and 0 is equal to 6

What will this evaluate to?

2) 6 is greater than 8, or -4 is less than 1

What will this evaluate to?

3) The String "purple" is the same as the String "blue", and 3 plus 5 equals 8

What will this evaluate to?

4) Write the contracts for and & or in your Contracts page.

Compound Inequalities: Solutions & Non-Solutions

For each Compound Inequality listed below, identify 4 solutions and 4 non-solutions. If there are **no solutions** or the solution set includes **all real numbers** you can write that instead of making a list.

- Solutions for *intersections*, which use **and** will make both of the expressions true .
- Solutions for *unions*, which use **or** will make at least one of the expressions true .

Pay special attention to the numbers in the sample expression! Challenge yourself to use negatives, positives, fractions, decimals, etc. for your x values.

The first two have been done for you - Answers will vary!

Expression	4 solutions that evaluate to true	4 non-solutions that evaluate to false
x > 5 and $x < 15$	6, 9.5, 12, 14.9	-2, 5, 15, 16.1
x > 5 or x < 15	All real numbers	No non-solutions
$x \leq -2$ and $x > 7$		
x <= -2 or x > 7		
x < 3.5 and $x > -4$		
x < 3.5 or x > -4		
$x \ge -1$ and $x \ge -5$		
$x \ge -1$ or $x \ge -5$		
x < -4 and $x > 2$		

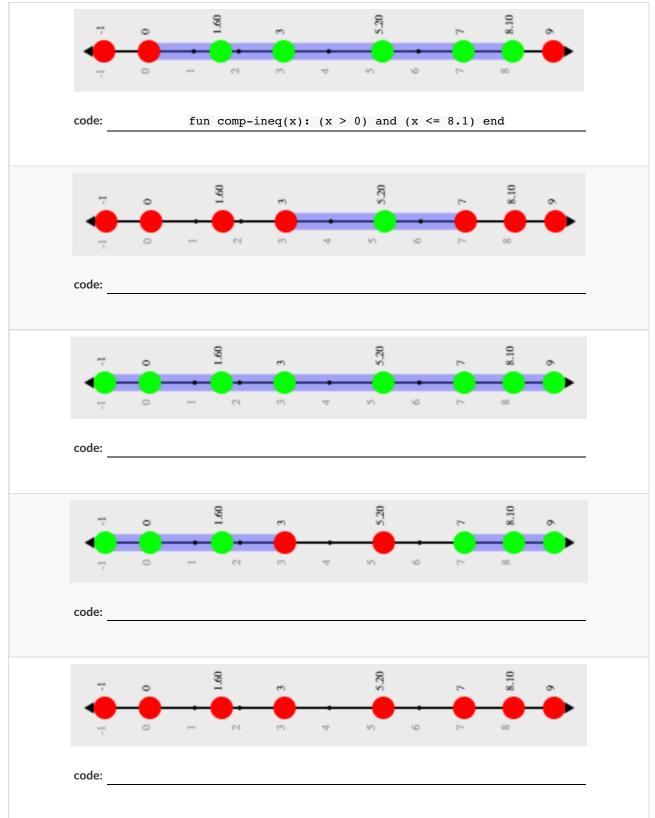

1) Could there ever be a union with no solutions ? Explain your thinking.

2) Could there ever be an intersection whose solution is *all real numbers*? Explain your thinking.

Compound Inequality Functions

Each of the plots below was generated using the code

inequality(comp-ineq, [list: -1, 0, 1.6, 3, 5.2, 7, 8.1, 9]). With the exception of the example, each plot below was defined using the numbers 3 and 7. Write the code for how comp-ineq was defined for each plot in the space provided.

Sam the Butterfly

Open the "Sam the Butterfly" starter file and press "Run". (*Hi*, *Sam*!) Move Sam around the screen using the arrow keys.

1) What do you notice about the program?

2) What do you wonder?

3) What do you see when Sam is at (0,0)? Why is that?

4) What changes as the butterfly moves left and right?

Sam is in a 640 × 480 yard. Sam's mom wants Sam to stay in sight.

How far to the left and right can Sam go and still remain visible?

Use the new inequality functions to answer the following questions with code :

5) Sam hasn't gone off the left edge of the screen as long as...

6) Sam hasn't gone off the right edge of the screen as long as...

7) Use the space below to draw Circles of Evaluation for these two expressions:

Left and Right

Directions: Use the Design Recipe to write a function is-safe-left, which takes in an x-coordinate and checks to see if it is greater than -50.

Piecewise Functions

- Sometimes we want to build functions that act differently for different inputs. For example, suppose a business charges \$10/pizza, but only \$5 for orders of six or more. How could we write a function that computes the total price based on the number of pizzas?
- In math, **Piecewise Functions** are functions that can behave one way for part of their Domain, and another way for a different part. In our pizza example, our function would act like cost(pizzas) = 10 * pizzas for anywhere from 1-5 pizzas. But after 5, it acts like cost(pizzas) = 5 * pizzas.
- Piecewise functions are divided into "pieces". Each piece is divided into two parts:
 - 1. How the function should behave
 - 2. The domain where it behaves that way
- Our programming language can be used to write piecewise functions, too! Just as in math, each piece has two parts: fun cost(pizzas):

```
ask:
    | pizzas < 6 then: 10 * pizzas
    | pizzas >= 6 then: 5 * pizzas
    end
end
```

Piecewise functions are powerful, and let us solve more complex problems. We can use piecewise functions in a video game to add or subtract from a character's x-coordinate, moving it left or right depending on which key was pressed.

Welcome to Alice's Restaurant!

Alice has hired you to improve some code used at the restaurant. The code we'll be improving on is shown below.

Read through the code line-by-line with your partner before writing down your observations in the tables below.

1 I notice	2 I wonder
3 Familiar things I see in the code	4) Unfamiliar things I see in the code
3 Familiar things I see in the code	4) Unfamiliar things I see in the code
3 Familiar things I see in the code	4) Unfamiliar things I see in the code
3 Familiar things I see in the code	4) Unfamiliar things I see in the code
3 Familiar things I see in the code	4) Unfamiliar things I see in the code

Alice's Restaurant - Explore

Alice's code has some new elements we haven't seen before, so let's experiment a bit to figure out how it works! Open the	3
"Alice's Restaurant starter file, click "Run", and try using the $cost$ function in the Interactions window.	
1) What does cost("hamburger") evaluate to?	
2) What does cost("pie") evaluate to?	
3) What if you ask for cost("fries")?	
4) Explain what the function is doing in your own words.	
5) What is the function's name? Domain? Range?	
6) What is the name of its variable?	
7) Alice says onion rings have gone up to 3.75 . Change the cost function to reflect this.	
8) Try adding menu items of your own. What's your favorite?	
9) For an unknown food item, the function produces the String "That's not on the menu!" Is this a problem? Wh or why not?	у

10) Suppose Alice wants to calculate the price of a hamburger, *including a 5% sales tax*. Draw a Circle of Evaluation for the expression below.

Word Problem: order

Directions: Alice's Restaurant has hired you as a programmer. They offer the following menu items: hamburger (\$6.00), onion rings (\$3.50), fried tofu (\$5.25) and pie (\$2.25). Write a function called order which takes in the name of a menu

Word Problem: update-player

Directions: The player moves up and down by 20 pixels each time. Write a function called update-player, which takes in the player's y-coordinate and the name of the key pressed ("up" or "down"), and returns the new y-coordinate. **Contract and Purpose Statement** Every contract has three parts... # •• -> function name domain range # what does the function do? Examples Write some examples, then circle and label what changes... examples:) is what the function produces input(s) function name) is input(s) what the function produces function name) is function name input(s) what the function produces) is what the function produces function name input(s) end Definition Write the definition, giving variable names to all your input values... fun (): function name variable(s) ask: then: I then: | otherwise: end end

Challenges for update-player

For each of the challenges below, see if you can come up with two EXAMPLEs of how it should work!

1) Warping - Program one key to "warp" the player to a set location, such as the center of the screen.

```
examples:

update-player() is

update-player() is

end
```

2) Boundaries - Change update-player such that PLAYER cannot move off the top or bottom of the screen.

```
examples:
   update-player( ) is
   update-player( ) is
end
```

3) Wrapping - Add code to update-player such that when PLAYER moves to the top of the screen, it reappears at the bottom, and vice versa.

```
examples:

update-player( ) is

update-player( ) is

end
```

4) Hiding - Add a key that will make PLAYER seem to disappear, and reappear when the same key is pressed again.

examples: update-player()	is
update-player(end)	is

Word Problem: line-length

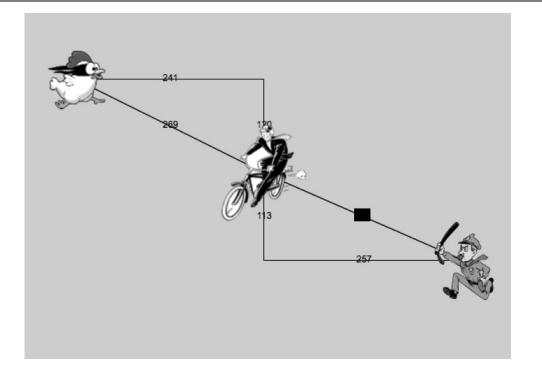

Dire	ections : Write a fund	ction called 'line-len	gth', whic	h takes in tw	o numbers and returns the	e positive difference	e
betv	veen them. It should	always subtract the	e smaller r	number from	the bigger one. If they are	equal, it should retu	urn zero.

Writing Code to Calculate Missing Lengths

In each of the game screenshots below, one of the distance labels has been hidden. Write the code to generate the missing distance on the line below each image. *Hint: Remember the Pythagorean Theorem!*

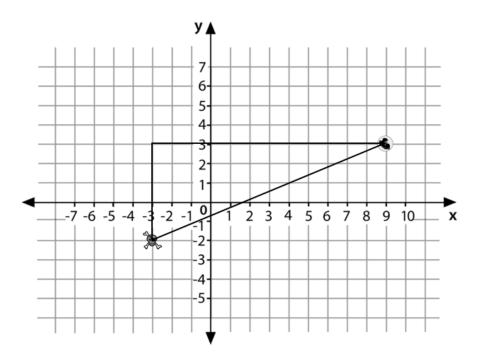

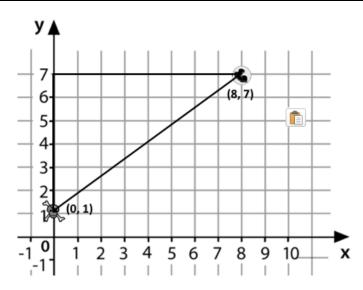

Distance on the Coordinate Plane

Distance between the pyret and the boot:

num-sqrt(num-sqr(line-length(9, -3)) + num-sqr(line-length(3, -2)))

Explain how the code works.

Now write the code to find the distance between this boot and pyret.

The Distance Between (0, 2) and (4, 5)

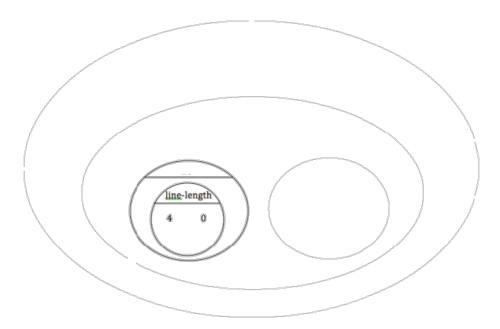

The distance between x_1 and x_2 is computed by line-length(x1, x2). The distance between y_1 and y_2 is computed by line-length(y1, y2). Below is the equation to compute the hypotenuse of a right triangle with those amount for legs:

 $\sqrt{line-length(x_1,x_2)^2+line-length(y_1,y_2)^2}$

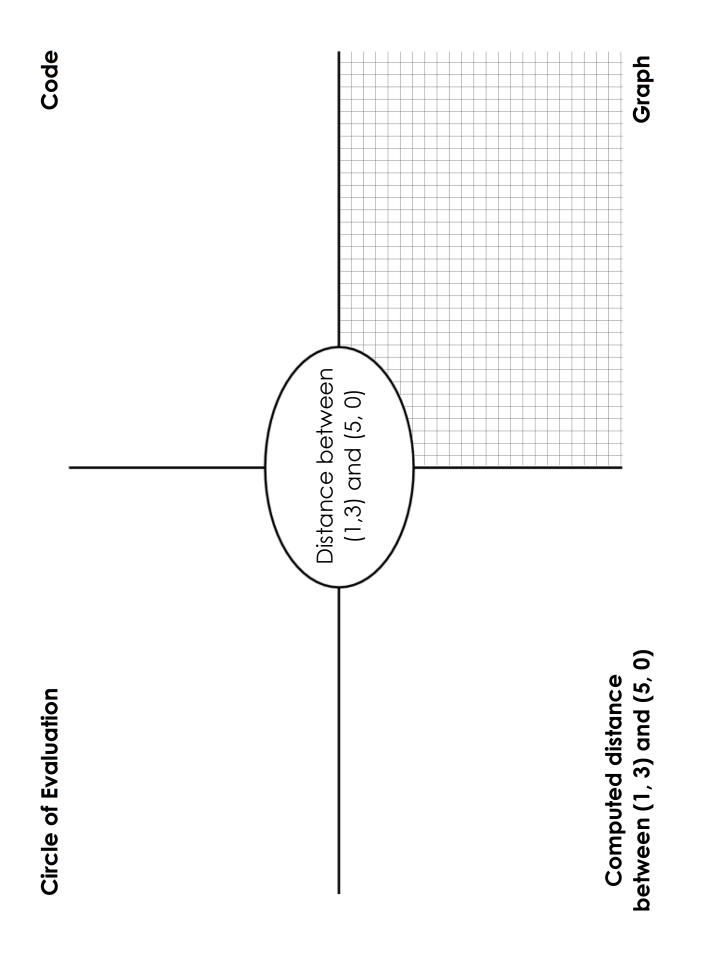

Suppose your player is at (0, 2) and a character is at (4, 5). What is the distance between them? With your pencil, label which numbers represent x_1 , y_1 , x_2 and y_2 . The equation to compute the distance between these points is:

 $\sqrt{line-length(0,4)^2+line-length(2,5)^2}$

1. Translate the expression above, for (0,2) and (4,5) into a Circle of Evaluation below .

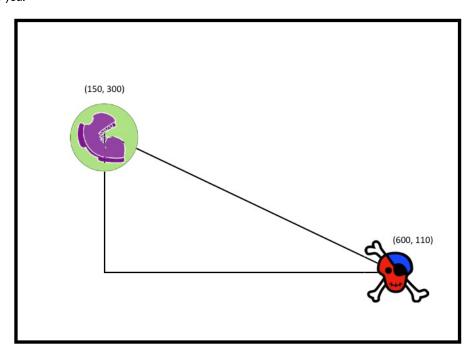

2. Convert the Circle of Evaluation to Code below .

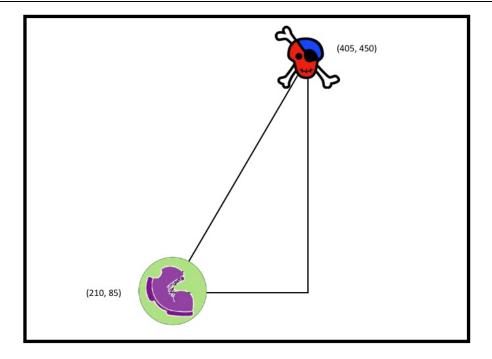

Distance From Game Coordinates

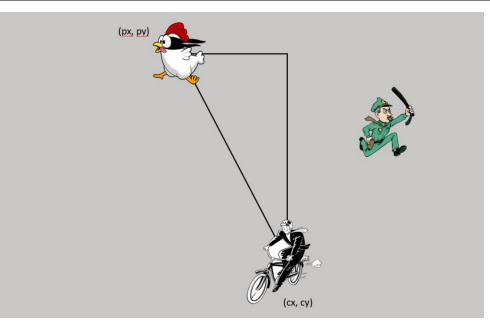

For each of the game screenshots, write the code to calculate the distance between the indicated characters. *The first one has been done for you.*

num-sqrt(num-sqr(line-length(600, 150)) + num-sqr(line-length(110, 300)))

Distance (px, py) to (cx, cy)

Word Problem: distance

Directions: Use the Design Recipe to write a function distance, which takes in FOUR inputs: px and py (the x- and y-coordinate of the Player) and cx and cy (the x- and y-coordinates of another character). coordinates of two objects and produces the distance between them in pixels.

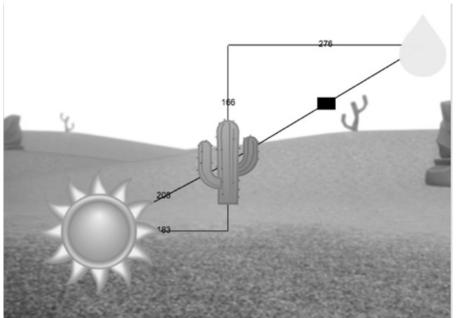

Contract and	d Purpose State	ement

end

what the function does with those variable(s)

Comparing Code: Finding Missing Distances

For each of the game screenshots below, the math and the code for computing the covered distance is shown. Notice what is similar and what is different about how the top and bottom distances are calculated. Think about why those similarities and differences exist and record your thinking.

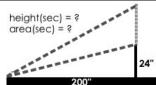

num-sqrt(num-sqr(166) + num-sqr(276))

Top Down / Bottom Up

A retractable flag pole starts out 24 inches tall, and grows taller at a rate of 0.6 in/sec. An elastic is anchored 200 inches from the base and attached to the top of the pole, forming a right triangle. Using a top-down or bottom-up strategy, define functions that compute the *height* of the pole and the *area* of the triangle after a given number of seconds.
